

Use Ensembl VEP to analyse your variation data locally. No limits, powerful, fast and extendable, command line Ensembl VEP is the way to get the most out of [Ensembl VEP](#) and Ensembl.

Ensembl VEP is a powerful and highly configurable tool -

have a browse through the [documentation](#). You might also like to read up on the [data formats](#) that Ensembl VEP uses, and the different ways you can access [genome data](#). The VEP script can annotate your variants with [custom data](#), be extended with [plugins](#), and use powerful [filtering](#) to find biologically interesting results.

Beginners should have a run through the [tutorial](#), or try the [web interface](#) first.

If you use Ensembl VEP in your work, please cite our latest publication **McLaren et. al. 2016** ([doi:10.1186/s13059-016-0974-4](https://doi.org/10.1186/s13059-016-0974-4))

Any questions? Send an email to the Ensembl [developers' mailing list](#) or contact the [Ensembl Helpdesk](#).

★ Quick start

1. Download

```
git clone https://github.com/Ensembl/ensembl-vep.git
```

2. Install

```
cd ensembl-vep
perl INSTALL.pl
```

3. Test

```
./vep -i examples/homo_sapiens_GRCh38.vcf --cache
```

Install Ensembl VEP

Have you downloaded Ensembl VEP yet? Use git to clone it:

```
git clone https://github.com/Ensembl/ensembl-vep
cd ensembl-vep
```

Ensembl VEP uses "cache files" or a remote database to read genomic data. Using cache files gives the best performance - let's set one up using the installer:

```
perl INSTALL.pl

Hello! This installer is configured to install v116 of the Ensembl API for use by VEP.
It will not affect any existing installations of the Ensembl API that you may have.

It will also download and install cache files from Ensembl's FTP server.

Checking for installed versions of the Ensembl API...done
It looks like you already have v116 of the API installed.
You shouldn't need to install the API

Skip to the next step (n) to install cache files

Do you want to continue installing the API (y/n)?
```

If you haven't yet installed the API, type "y" followed by enter, otherwise type "n" (perhaps if you ran the installer before). At the next prompt, type "y" to install cache files

```
Do you want to continue installing the API (y/n)? n
- skipping API installation

Ensembl VEP can either connect to remote or local databases, or use local cache files.
Cache files will be stored in /nfs/users/nfs_w/wm2/.vep
Do you want to install any cache files (y/n)? y

Downloading list of available cache files
The following species/files are available; which do you want (can specify multiple separated by spaces):
1 : ailuropoda_melanoleuca_vep_116_ailMel1.tar.gz
2 : anas_platyrhynchos_vep_116_BGI_duck_1.0.tar.gz
3 : anolis_carolinensis_vep_116_Anocar2.0.tar.gz
...
42 : homo_sapiens_vep_116_GRCh38.tar.gz
...
?
```

Type "42" (or the relevant number for homo_sapiens and GRCh38) to install the cache for the latest human assembly. This will take a little while to download and unpack! By default Ensembl VEP assumes you are working in human; it's easy to switch to any other species using `--species [species]`.

```
? 42
- downloading https://ftp.ensembl.org/pub/release-
116/variation/vep/homo_sapiens_vep_116_GRCh38.tar.gz
- unpacking homo_sapiens_vep_116_GRCh38.tar.gz

Success
```

Run Ensembl VEP

Ensembl VEP needs some input containing variant positions to run. In their most basic form, this should just be a chromosomal location and a pair of alleles (reference and alternate). Ensembl VEP can also use common formats such as VCF and HGVS as input. Have a look at the [Data formats](#) page for more information.

We can now use our cache file to run Ensembl VEP on the supplied example file **examples/homo_sapiens_GRCh38.vcf**, which is a VCF file containing variants from the 1000 Genomes Project, remapped to GRCh38:

```
./vep -i examples/homo_sapiens_GRCh38.vcf --cache

2013-07-31 09:17:54 - Read existing cache info
2013-07-31 09:17:54 - Starting...
ERROR: Output file variant_effect_output.txt already exists. Specify a different output file
with --output_file or overwrite existing file with --force_overwrite
```

You may see this error message if you've already run Ensembl VEP in the same directory. It will not overwrite your existing files unless you request this. So let's tell it to using [--force_overwrite](#)

```
./vep -i examples/homo_sapiens_GRCh38.vcf --cache --force_overwrite
```

By default Ensembl VEP writes to a file named "variant_effect_output.txt" - you can change this file name using [-o](#). Let's have a look at the output.

```
head variant_effect_output.txt

## ENSEMBL VARIANT EFFECT PREDICTOR v116.0
## Output produced at 2017-03-21 14:51:27
## Connected to homo_sapiens_core_116_38 on ensembldev.ensembl.org
## Using cache in /homes/user/.vep/homo_sapiens/116_GRCh38
## Using API version 116, DB version 116
## polyphen version 2.2.2
## sift version sift5.2.2
## COSMIC version 78
## ESP version 20141103
## gencode version GENCODE 25
## genebuild version 2014-07

## dbSNP version 147
## Column descriptions:
## Uploaded_variation : Identifier of uploaded variant
## Location : Location of variant in standard coordinate format (chr:start or chr:start-end)
## Allele : The variant allele used to calculate the consequence
## Gene : Stable ID of affected gene
## Feature : Stable ID of feature
## Feature_type : Type of feature - Transcript, RegulatoryFeature or MotifFeature
## Consequence : Consequence type
## cDNA_position : Relative position of base pair in cDNA sequence
## CDS_position : Relative position of base pair in coding sequence
## Protein_position : Relative position of amino acid in protein
## Amino_acids : Reference and variant amino acids
## Codons : Reference and variant codon sequence
## Existing_variation : Identifier(s) of co-located known variants
## Extra column keys:
## IMPACT : Subjective impact classification of consequence type
## DISTANCE : Shortest distance from variant to transcript
## STRAND : Strand of the feature (1/-1)
## FLAGS : Transcript quality flags
```

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

```
rs7289170      22:17181903  G      ENSG00000093072  ENST00000330232  Transcript
synonymous_variant ...
```

The lines starting with "#" are header or meta information lines. The final one of these (highlighted in blue above) gives the column names for the data that follows. To see more information about Ensembl VEP's output format, see the [Data formats](#) page.

We can see two lines of output here, both for the uploaded variant named rs7289170. In many cases, a variant will fall in more than one transcript. Typically this is where a single gene has multiple splicing variants. Here our variant has a consequence for the transcripts ENST00000262607 and ENST00000330232.

In the consequence column, we can see the term 'synonymous_variant'. This term is from the [Sequence Ontology \(SO\)](#), which describes the predicted molecular effects of sequence variants on genomic features. See our [predicted data](#) page for a guide to the consequence types used in Ensembl VEP.

Let's try something a little more interesting. SIFT is an algorithm for predicting whether a given change in a protein sequence will be deleterious to the function of that protein. Ensembl VEP can give SIFT predictions for most of the missense variants in human and other highly studied species. To do this, simply add `--sift b` (the b means we want both the prediction and the score):

```
./vep -i examples/homo_sapiens_GRCh38.vcf --cache --force_overwrite --sift b
```

SIFT calls variants either "deleterious" or "tolerated". We can use the [filtering tool](#) to find only those that SIFT considers deleterious:

```
./filter_vep -i variant_effect_output.txt -filter "SIFT match deleterious" | grep -v "##" | head -n5
```

#Uploaded_variation	Location	Allele	Gene	Feature	...	Extra
rs2231495	22:17188416	C	ENSG00000093072	ENST00000262607	...	
SIFT=deleterious(0.05)						
rs2231495	22:17188416	C	ENSG00000093072	ENST00000399837	...	
SIFT=deleterious(0.05)						
rs2231495	22:17188416	C	ENSG00000093072	ENST00000399839	...	
SIFT=deleterious(0.05)						
rs115736959	22:19973143	A	ENSG00000099889	ENST00000263207	...	
SIFT=deleterious(0.01)						

Note that the SIFT score appears in the "Extra" column, as a key/value pair. This column can contain multiple key/value pairs depending on the options you give to Ensembl VEP. See the [Data formats](#) page for more information on the fields in the Extra column.

You can also configure how Ensembl VEP writes its output using the `--fields` flag.

You'll also see that we have multiple results for the same gene, ENSG00000093072. Let's say we're only interested in what is considered the canonical transcript for this gene (`--canonical`), and that we want to know what the commonly used gene symbol from HGNC is for this gene (`--symbol`). We can also use a UNIX pipe to pass the output from Ensembl VEP directly into the filtering tool:

```
./vep -i examples/homo_sapiens_GRCh38.vcf --cache --force_overwrite --sift b --canonical --symbol --tab --fields Uploaded_variation,SYMBOL,CANONICAL,SIFT -o STDOUT | \
./filter_vep --filter "CANONICAL is YES and SIFT match deleterious"
```

```
...
```

#Uploaded_variation	SYMBOL	CANONICAL	SIFT
rs2231495	CECR1	YES	deleterious(0.05)
rs115736959	ARVCF	YES	deleterious(0.01)
rs116398106	ARVCF	YES	deleterious(0)
rs116782322	ARVCF	YES	deleterious(0)
...	...	...	...
rs115264708	PHF21B	YES	deleterious(0.03)

So now we can see all of the variants that have a deleterious effect on canonical transcripts, and the symbol for their genes. Nice!

For [species with an Ensembl database of variants](#), Ensembl VEP can be configured to annotate your input with identifiers and frequency data from variants co-located with your input data. For human, Ensembl VEP's cache contains frequency data from the 1000 Genomes Project and gnomAD. Since our input file is from the 1000 Genomes Project, let's add frequency data

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

```
./vep -i examples/homo_sapiens_GRCh38.vcf --cache --force_overwrite --af_1kg -o STDOUT | grep  
-v "##" | head -n2
```

```
#Uploaded_variation Location Allele Gene Feature ...  
Existing_variation Extra  
rs7289170 22:17181903 G ENSG00000093072 ENST00000262607 ... rs7289170  
IMPACT=LOW;STRAND=-1;AFR_AF=0.2390;AMR_AF=0.2003;EAS_AF=0.0456;EUR_AF=0.3211;SAS_AF=0.1401
```

We can see frequency data for the AFR, AMR, EAS, EUR and SAS continental population groupings; these represent the frequency of the alternate (ALT) allele from our input (G in the case of rs7289170). Note that the Existing_variation column is populated by the identifier of the variant found in the Ensembl VEP cache (and that it corresponds to the identifier from our input in Uploaded_variation). To retrieve only this information and not the frequency data, we could have used [--check_existing](#) ([--af_1kg](#) silently switches on [--check_existing](#)).

Over to you!

This has been just a short introduction to the capabilities of Ensembl VEP - have a look through some more of the [options](#), see them all on the command line using [--help](#), or try using the shortcut [--everything](#) which switches on almost all available output fields! Try out the different options in the [filtering tool](#), and if you're feeling adventurous why not use some of your [own data to annotate your variants](#) or have a go with a [plugin](#) or two.

Download

Download ensembl-vep package (see below the different ways to download it) and then follow the [installation instructions](#).

Using Git

• Clone the Git repository

Use git to download the ensembl-vep package:

```
git clone https://github.com/Ensembl/ensembl-vep.git
cd ensembl-vep
```

• Update to a newer version

To update from a previous version:

```
cd ensembl-vep
git pull
git checkout release/116
perl INSTALL.pl
```

• Use an older version

To use an older version (this example shows how to set up release 87):

```
cd ensembl-vep
git checkout release/87
perl INSTALL.pl
```

Download the Zipped package file

Users without the git utility installed may download a zip file from GitHub, though we would always recommend using git if possible.

```
curl -L -O https://github.com/Ensembl/ensembl-vep/archive/release/116.zip
unzip 116.zip
cd ensembl-vep-release-116/
```

Previous versions (ensembl-tools)

Previously, Ensembl VEP was available as part of the ensembl-tools package (see the [Ensembl 87 VEP script PDF](#) for documentation). The following downloads are available for archival purposes.

What's new?

New in version 116 (*June 2026*)

- New and updated Ensembl VEP plugin(s) (supported on CLI, Web and REST):
 - [ProtVar](#) - provides contextualised information for missense variation from [ProtVar Tool](#), including impact predictions on destabilisation of protein structures, overlapping protein pockets, and protein-protein interaction interfaces.
 - [OpenTargets](#) - Redesigned to work with the updated OpenTargets resource, this plugin integrates data from the [OpenTargets Platform](#), a target identification tool that includes comprehensive variant annotation and the results of state-of-the-art large-scale statistical analyses, including fine-mapping, colocalisation, and locus-to-gene assignment across all complex and molecular traits.
- New Ensembl VEP plugin(s) (supported on CLI):
 - [gnomADMT](#) - retrieves allele frequencies for mitochondrial variants from the gnomAD genomes mitochondrial annotations files, enabling annotation of MT variants with allele frequencies.
 - [PromoterAI](#) - a plugin that adds Illumina's PromoterAI scores to promoter variants, predicting their impact on gene expression.
- Updated plugin data for dbNSFP -> version 5.3.1.

Previous version history - from version 88:

New in version 115 (*September 2025*)

- Added Ensembl VEP support for annotating structural variants with allele frequencies from gnomAD and clinical significance (CLINSIG) from ClinVar.
- Added Ensembl VEP and Ensembl Variation API support for the new [ClinVar somatic classifications](#).
- We have enabled support for [GENCODE promoters](#); variants falling within them can now be annotated with details of the promoter
- New plugin (on CLI):
 - [MechPredict](#)

New in version 114 (*May 2025*)

- MAVE data has been updated from the latest version of MaveDB, representing a nearly 6.5 fold increase in variants covered (~1.2 million to ~7.7 million).

- Support for https protocol when downloading FTP files and adding GitHub Token to increase rate limit in Ensembl

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

- Allele frequency from NIH APOE study is now available in the web Ensembl VEP
- you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- Plugin support added to REST for:
 - [Paralogues](#)
- Plugin data version updated:
 - [dbNSFP](#) (from 4.7c to 4.9c)
 - [LOEUF](#) (from gnomAD v2.1.1 to gnomAD v4.1)
- Plugin deprecated:
 - [DisGeNET](#)
 - [Mastermind](#) (Only from REST)

New in version 113 (October 2024)

- gnomAD frequency data updated to v4.1 for both genomes and exomes.
- Support for GENCODE primary transcript set added. See, [--gencode_primary](#) and [--flag_gencode_primary](#).
- Support added for [--mane](#), [--mane_select](#), and [--canonical](#) when GFF/GTF file used as annotation source.
- Nextflow Ensembl VEP now supports other input data formats besides VCF. For supported formats see - [Data formats](#).
- Plugin support added to REST and Web for:
 - [RiboseqORFs](#)
 - [REVEL](#)
 - [ClinPred](#)
- Plugin support added to Web for:
 - [Paralogues](#)
- Plugin support added to REST for:
 - [LOEUF](#)
- Plugin data version updated for CADD (v1.6 to v1.7) and dbNSFP (4.5c to 4.7c).

New in version 112 (May 2024)

- Enhanced Structural Variant Support:
 - Added support for CNV:TR
 - Enabled the use of chromosome synonyms in breakends
 - Report consequences for each breakend and enable the input of single breakends
- New plugins (supported on CLI, Web and REST):
 - [AlphaMissense](#) - annotates missense variants with the pre-computed AlphaMissense pathogenicity scores. AlphaMissense is a deep learning model developed by Google DeepMind that predicts the pathogenicity of single nucleotide missense variants.
- New plugins (supported on CLI and Web):
 - [RiboseqORFs](#) - uses a standardized catalog of human Ribo-seq ORFs to re-calculate consequences for variants located in these translated regions
- New plugins (supported on CLI):
 - [Paralogues](#) - fetches variants overlapping the genomic coordinates of amino acids aligned between paralogue proteins
 - [AVADA](#) - Automatic VArant evidence DAtabase is a novel machine learning tool that uses natural language processing to automatically identify pathogenic genetic variant evidence in full-text primary literature about monogenic disease and convert it to genomic coordinates
 - [GeneBe](#) - A plugin kindly contributed by the GeneBe team, it retrieves automatic ACMG variant classification data from <https://genebe.net/>
 - [PhenotypeOrthologous](#) A VEP plugin that retrieves phenotype information associated with orthologous genes from model organisms

- Plugin support added to REST and Web for:

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

- [CADD SV](#)

- [CADD](#) scores for SVs and you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- [Dosage Sensitivity](#)
- [Enformer](#)

New in version 111 (January 2024)

- New option `--individual zyg` returns a single list of individuals and their zygosity (instead of a separate line of output for each individual and variant combination like in `--individual`)
- [Custom annotation](#) has been improved with the following options:
 - [num_records](#) to limit the number of matching records (50 by default)
 - [summary_stats](#) to calculate summary statistics (min, mean, max, count, sum) using annotation scores (not used by default)
- New plugin (supported on CLI, REST and web):
 - [OpenTargets](#) - Report trait associations from Open Targets Platform through GWAS- or QTL-gene associations, including locus-to-gene (L2G) scores for GWAS loci
- New plugin (supported on CLI and REST):
 - [Enformer](#) - adds pre-calculated predictions of variant impact on gene expression
- New plugins (supported on CLI):
 - [BayesDel](#) - adds a deleteriousness meta-score combining multiple deleteriousness predictors
 - [DeNovo](#) - identifies de novo variants in a VCF file. This plugin requires a pedigree (.ped) file
 - [SpliceVault](#) - predicts exon-skipping events and activated cryptic splice sites based on the most common mis-splicing events around a splice site
 - [DosageSensitivity](#) - annotates the likelihood of a gene being haploinsufficient or triplosensitive
 - [VARITY](#) - adds pre-calculated pathogenicity scores of rare human missense variants

New in version 110 (July 2023)

- New plugins (supported on CLI):
 - [TranscriptAnnotator](#) - an Ensembl VEP plugin that annotates variant-transcript pairs
- New Plugins (supported on CLI, REST and web):
 - [Geno2MP](#) - adds information from Geno2MP, a web-accessible database of rare variant genotypes linked to phenotypic information
 - [MaveDB](#) - adds information from MaveDB, a database that holds experimentally determined measures of variant effect

New in version 109 (February 2023)

- [Ensembl VEP Docker image](#) now includes all Ensembl VEP plugins
- New plugin (supported on CLI):
 - [GWAS](#) - reports genome-wide association study data from GWAS catalog
- Plugins now available in REST and web:
 - [UTRAnnotator](#) - annotates the effect of 5' UTR variant especially for variant creating/disrupting upstream ORFs
- Plugins now available in REST:
 - [NMD](#) - predicts if a variant allows transcript to escape nonsense-mediated mRNA decay based on certain rules
- Plugin LOEUF replaces Loftool in the web with more recent 'loss-of-function' score for variants
- Deprecated Plugins:
 - [miRNA](#) - this plugin was fully deprecated in favour of `--mirna` flag (in web and REST)
 - [ExAC](#) - this plugin was deprecated given that Ensembl VEP cache includes ExAC data as part of gnomAD
- SIFT version has been updated from 5.2.2 to 6.2.1 (except for human GRCh37)
- PolyPhen-2 version has been updated from 2.2.2 to 2.2.3 (except for human GRCh37)

New in version 108 (October 2022)

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

- [mutfunc](#) - predicts destabilization of protein structure, interaction and others features by a variant (GRCh38)
- you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- Plugin feature extension:

- [IntAct](#) - 4 new species are now supported - rat, chicken (red jungle fowl), yeast, and arabidopsis

New in version 107 (July 2022)

- New plugin (supported on CLI, REST, and web):
 - [EVE](#) - annotates human variants using EVA classification method based solely on evolutionary sequences (GRCh38 only)
- Plugins now available in REST and web (already available in CLI):
 - [GO](#) - retrieves Gene Ontology terms associated with transcripts/translations
 - [IntAct](#) - annotates human variants which fall in interaction sites, as described in the IntAct database
- Plugins now available in web (already available in CLI):
 - [NMD](#) - predicts if a stop_gained variant allows transcript to escape nonsense-mediated mRNA decay based on certain rules
- Readthrough transcripts are now removed from cache
- Transcripts of biotype 'artifact' which are artifactual duplication are now removed from cache and not accessible using database
- gnomAD allele frequencies are now available for exomes and genomes separately through `--af_gnomad` and `--af_gnomadg` options respectively. The `--af_gnomad` option have same function as `--af_gnomad`.

New in version 106 (April 2022)

- New plugins for command line use:
 - [IntAct](#) - annotates human variants which fall in interaction sites, as described in the IntAct database
 - [CAPICE](#) - integrates scored from a machine-learning-based method for prioritizing pathogenic variants (GRCh37 only)
- Nextflow pipeline:
 - A new configurable pipeline is available to run Ensembl VEP efficiently on large scale VCF

New in version 105 (December 2021)

- 3 new Sequence Ontology terms are reported for more detailed splice consequence annotation
 - splice_donor_5th_base_variant ([SO:0001787](#))
 - splice_donor_region_variant ([SO:0002170](#))
 - splice_polypyrimidine_tract_variant ([SO:0002169](#))
- New plugins
 - [ClinPred](#) - adds pre-calculated scores from ClinPred which helps identify disease-relevant missense variants
 - [NMD](#) - predicts whether a stop-gained variant will allow a transcript to escape nonsense-mediated decay
- Condor scores are no longer available via the Ensembl VEP web interface as they have not been updated since 2014 and newer scores like CADD and REVEL are available

New in version 104 (May 2021)

- Human GRCh37 cache files now include dbSNP 154!
- `--var_synonyms` output structure has been altered when used with `--json`
- Ensembl VEP Plugins:
 - [dbNSFP](#) - now supports matching by peptides
 - [SpliceAI](#) - now compares gene symbols to improve score accuracy

New in version 103 (February 2021)

- **New:** Variant Recoder is now available as a web tool
- Variant Recoder output is now allele specific
- Web Ensembl VEP Options:

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

- MasterMind results are available through the REST and web interfaces you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- Ensembl VEP Options:
 - [--mane](#) : Now provides additional MANE Plus Clinical annotations alongside MANE Select
 - [--mane_select](#) : Returns MANE Select annotations

New in version 102 (November 2020)

- Ensembl VEP options:
 - [--uniprot](#): Now we report precise Ensembl translation to UniProt isoform mappings.
 - [--spdi](#) - **new**: Add genomic [SPDI](#) notation.
- Web Ensembl VEP options:
 - Shifting variants in the 3' direction with [--shift_3prime](#) and [--shift_genomic](#) is now supported through the web interface.
 - [SpliceAI](#) - **new**: SpliceAI pre-calculated scores are available through the web interface.
- Ensembl VEP filter options:
 - [--soft_filter](#) - **new**: Option to only flag the failing variation in the FILTER column and keep the entries in the output VCF file.

New in version version 101 (August 2020)

- New options:
 - [--var_synonyms](#): Report known synonyms for colocated variants. Must be used with [--cache](#).
- Ensembl VEP plugins:
 - [neXtProt](#) - **new**: neXtProt retrieves comprehensive human-centric protein-related data for missense variants

New in version 100 (April 2020)

- Human GRCh37 variant and phenotype data has been updated with multiple data sets including dbSNP153, ClinVar's 201912 release and COSMIC release 90
- The GRCh37 RefSeq transcript set has been updated to NCBI's 1st November 2019 release (initially annotated on GCF_000001405.25)!
- New options:
 - [--shift_3prime](#): Right aligns all variants relative to their associated transcripts prior to consequence calculation
 - [--shift_genomic](#): Right aligns all variants, including intergenic variants, before consequence calculation and updates the *Location* field
- Ensembl VEP plugins:
 - [SpliceAI](#) - **new**: SpliceAI is a deep neural network, developed by Illumina, Inc that predicts splice junctions from an arbitrary pre-mRNA transcript sequence.

New in version 99 (January 2020)

- Human GRCh38 cache files now contain variants from dbSNP153
- New options have been added to REST:
 - `vcf_string`: Ensembl VEP can now provide a VCF-like string representing the input variant
 - `transcript_version`: Add version numbers to Ensembl transcript identifiers
 - `SpliceRegion`: Provides granular predictions of splicing effects ([Details](#))
 - `LoF`: LOFTEE implements a set of filters to predict LoF (loss-of-function) variants. ([Details](#))

New in version 98 (September 2019)

- Human GRCh38 cache files now contain variants from dbSNP152
- This employs a new clustering strategy which may result in different rsIDs being reported as known variants for some insertions and deletions - for more information see [here](#)

- [--clin_sig_allele](#) has been updated to be used by default

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

- New options:

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- [--custom_multi_allelic](#): prevents Ensembl VEP from assuming that comma separated lists in custom annotations are allele specific
- MANE attributes are now included within Ensembl VEP cache files, web Ensembl VEP and REST
- Ensembl VEP plugins:
 - [satMutMPRA](#) - **new**: measures variant effects on gene RNA expression for 21 regulatory elements
- Ensembl VEP Installer:
 - HTSLib v1.9 is now installed by default (previously v1.3.2)
 - Bio::DB::HTS v2.11 is now installed by default (previously v2.9)
 - New option 'PLUGINS_DIR' allows you to specify the installation directory for plugins

New in version 97 (July 2019)

- Allele-specific clinical significance reported (it was previously variant-specific).
- New options:
 - [--clin_sig_allele](#): report allele specific clinical significance.
 - [--mane](#): report if a transcript is the MANE Select.
 - [--max_sv_size](#): extend the maximum Structural Variant size Ensembl VEP can process.
 - [--no_check_variants_order](#): permit the use of unsorted input files (WARNING - this is slow and requires more memory).
 - [--overlaps](#): report the proportion and length of a transcript overlapped by a structural variant in VCF format.
- Include the [--mane](#) option into the [--everything](#) group option.
- Update [--pick](#) and [--pick_order](#) to support MANE Select transcripts.
- Check if the input variants are ordered: non ordered variants slow down Ensembl VEP and require more memory.
- Skip annotation of complex and long structural variants and display a warning message.
- Variant recoder: add an option [--vcf_string](#) to return results in VCF format.
- Ensembl VEP plugins:
 - [FunMotifs](#) - **new**: provide information about overlapping tissue-specific transcription factor motifs.
 - [Mastermind](#) - **new**: reports variants that have clinical evidence cited in the medical literature.
 - [StructuralVariantOverlap](#) - **new**: provide information from overlapping structural variants.
 - [G2P](#) - **update**: now the plugin can be run offline.
 - [Phenotypes](#) - **update**: change the format of the data file (from BED to GVF).
- Ensembl VEP web tool: the transcript identifiers are now returned with versions unless otherwise specified.
- Ensembl VEP installer: tabix-indexed variant cache files are now installed by default.

New in version 96 (April 2019)

- Add **SPDI** format for Ensembl VEP (input) and Variant Recoder (input and output).
- Update Ensembl VEP cache with **gnomAD 2.1** (human).
- Update the Docker Ensembl VEP base image to **Ubuntu 18.04**.
- Retire deprecated flags: [--gmaf](#), [--maf_1kg](#), [--maf_esp](#), [--maf_exac](#), [--check_alleles](#), [--html](#), [--gvf](#).
- Retire legacy code about the pileup input format, which is no longer supported.
- Deprecate the installation flag ["--VERSION"](#)
- Force numbers to be encoded as numbers in JSON output
- Ensembl VEP plugins:
 - [NearestExonJB](#) - **new**: find the nearest exon junction boundary to a coding sequence variant.
 - [Conservation](#) - **update**: can use BigWig files instead of the Ensembl Compara database.
 - [dbNSFP](#) - **update**: support of the dbNSFP data version 4.

New in version 95 (January 2019)

- The Ensembl VEP parser is now more permissive for the GFF files (ID attribute only required for genes and transcripts)
- Add new option `--show_ref_allele` to include the allele reference in the VEP default output and the tab output formats
- Add a warning message when the Ensembl VEP annotations INFO field hasn't been found/recognised in the VCF input file
- Ensembl VEP Docker image:
 - Reduce the size of the Ensembl VEP Docker image by about 45%.
 - Include the Linkage disequilibrium script in the Ensembl VEP Docker image, making possible to run the LD plugin
- New Ensembl VEP plugins:
 - [Reference quality](#)
 - [OpenTargets results \(POSTGAP\)](#)
 - [Single letter amino acid for HGVS](#)

New in version 94 (October 2018)

- RefSeq transcript version updated.
- Minor updates on the [Ensembl VEP web tool](#) interface.
- When the input data format is not specified on the command line, Ensembl VEP attempts to detect it. The assumed format is now reported in verbose mode (`--verbose`).
- Ensembl VEP assigns assigned the consequence types *TF_binding_site_variant*, *TFBS_ablation*, *TFBS_fusion*, *TFBS_amplification* and *TFBS_translocation* to human and mouse variants which overlapped motif features. These annotations will not be available in VEP caches for human in release 94 so must be added as a [custom annotation](#).

New in version 93 (July 2018)

- Update the JSON output format (allele frequencies) for the [Ensembl REST - Ensembl VEP](#) endpoints. [See more information](#).
- The new Ensembl release brings more frequency data from [gnomAD](#).
- Add the possibility to print the content of the FILTER column (from the VCF custom annotation files) in the output.
- Include the [Ensembl/ensembl-xs](#) repository in Docker image to speed up the Ensembl VEP container.
- Add a new consequence 'extended_intronic_splice_region_variant' in the [SpliceRegion](#) Ensembl VEP plugin.

New in version 92 (April 2018)

- New Ensembl VEP plugin [REVEL](#) (see [REVEL plugin](#)).
- Get ambiguity code with `--ambiguity`.
- [GFF/GTF files](#) with exons assigned to multiple transcripts are now supported.
- Improved 1000 Genomes Project frequencies.

New in version 91 (December 2017)

- New input format "[region](#)" allows REST-style input to Ensembl VEP.
- Replace your input variant reference allele with the correct one from the genome with `--lookup_ref`.
- Add version numbers to Ensembl transcripts with `--transcript_version`.

New in version 90 (August 2017)

- [gnomAD](#) exomes allele frequencies now available with `--af_gnomad`, replacing ExAC. gnomAD genomes and ExAC are [available via custom annotation](#).
- Ensembl VEP is now available as a [Docker image](#).
- RefSeq transcripts in Ensembl VEP cache files are now ["corrected" from the reference genome sequence](#).

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#).

- Feed input directly to Ensembl VEP with [--input_data](#).
- Suppress header output with [--no_headers](#).
- Detailed [installation instructions for Bio::DB::BigFile](#) to access bigWig custom annotation files.

New in version 89 (May 2017)

- exclude known variants with unknown (null) alleles with [--exclude_null_alleles](#).
- write compressed output with [--compress_output](#).
- improved matching of alleles in [custom VCF files](#).
- API perldoc documentation added.

New in version 88 (March 2017)

- ensembl-vep is now the officially supported version of Ensembl VEP
- Documentation updated to reflect switch to ensembl-vep. See the [Ensembl 87 VEP script PDF](#) for documentation of the obsolete ensembl-tools Ensembl VEP.
- The Ensembl VEP script is now named simply `vep` (formerly `variant_effect_predictor.pl` or `vep.pl`)
- Directly use tabix-indexed [GFF/GTF files as annotation sources](#)
- Allele-specific reporting of frequencies ([--af](#) and more) and [custom VCF annotations](#)
- [--check_existing](#) now compares alleles by default, disable with [--no_check_alleles](#)
- Report the highest allele frequency observed in any population from 1000 genomes, ESP or ExAC using [--max_af](#)
- Get genomic HGVS nomenclature with [--hgvs](#)
- Find the gene or transcript with the nearest transcription start site (TSS) to each input variant with [--nearest](#)
- [filter_vep](#) supports field/field comparisons e.g. `AFR_AF > #EUR_AF`
- Exclude predicted (XM and XR) transcripts when using RefSeq or merged cache with [--exclude_predicted](#)
- Filter transcripts used for annotation with [--transcript_filter](#)
- pileup input format no longer supported

Older versions (ensembl-tools) - until version 87:

Versions of Ensembl VEP up to and including 87 were released as part of the ensembl-tools package. See [download links](#) above.

New in version 87 (December 2016)

- [Shiny new code](#) available for beta testing!
- Some minor speed optimisations
- Improve checks for valid chromosome names in input
- [Haplosaurus](#) beta released - generate whole-transcript haplotype sequences from phased genotype data

New in version 86 (October 2016)

- Chromosome synonyms supported when using Ensembl VEP caches; may be loaded manually with [--synonyms](#)

New in version 85 (July 2016)

- [--pick](#) now uses translated length instead of genomic transcript length
- Support for epigenomes in regulatory features

New in version 84 (March 2016)

- Add [tab-delimited](#) output option
- Add [transcript flags](#) indicating if the transcript is 5'- or 3'-incomplete
- Improve annotation of long variants where invariant parts of the alternate allele overlap splice regions

New in version 83 (December 2015)

- Speed:

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- Basic consequence calculations up to 2x faster than version 82
- HGVS calculations up to 10x faster
- FASTA sequence retrieval implements caching

- Add [ExAC project](#) frequencies with `--af_exac`
- [APPRIS](#) isoform annotations now available with `--appris` and used by `--pick` and others to prioritise VEP annotations

New in version 82 (September 2015)

- [Faster FASTA file access](#) using Bio::DB::HTS/htslib and bgzipped FASTA files
- [Flag_genes](#) with phenotype associations
- Some plugins now available for use via the [web](#) and [REST](#) interfaces

New in version 81 (July 2015)

- Plugin registry means plugins can be installed from the [Ensembl VEP installer](#)
- GFF format now supported by Ensembl VEP's [cache converter](#)
- Fixes and improvements for sequence retrieval from FASTA files

New in version 80 (May 2015)

- [Flag_added](#) indicating if an overlapping known variant is associated with a phenotype, disease or trait
- HGVS notations are now 3'-shifted by default (use `--shift_hgvs` to force enable/disable)
- Source version information added to caches; see output file headers or use `--show_cache_info`
- Get the variant class using `--variant_class`
- CCDS status added to categories used by `--pick` flag (and [others](#))

New in version 79 (March 2015)

- Focus on performance and stability: ~100% faster than version 78 and a new test suite
- New guide to [getting Ensembl VEP running faster](#)
- 1000 Genomes Phase 3 data available in GRCh37 cache download (GRCh38 coming soon, see [docs](#) to access now)
- [VCF output](#) has changed slightly to match output from other tools
- Impact modifier added for each consequence type

New in version 78 (December 2014)

- Customise `--pick` using `--pick_order`
- Get [transcript support level](#) using `--tsl`

New in version 77 (October 2014)

- Get the [SO](#) feature type of regulatory features using `--regulatory` and `--biotype`

New in version 76 (August 2014)

- Ensembl VEP now supports caches from multiple assemblies (`--assembly`) on the same software version - e.g. [human builds GRCh37 and GRCh38](#)
- Protein identifiers from UniProt (SWISSPROT, TrEMBL and UniParc) now available using `--uniprot`
- Ensembl VEP can generate [JSON output](#) using `--json`
- Two new analysis set options - `--gencode_basic` and the merged Ensembl/RefSeq cache (`--merged`)
- Non-RefSeq transcripts now excluded by default when using the RefSeq or merged cache; use `--all_refseq` to include them
- Let Ensembl VEP pick one consequence per variant allele using `--pick_allele`
- Allele now included alongside frequency for 1000 Genomes (`--af_1kg`) and ESP (`--af_esp`) data
- Not strictly script-related, but the [Ensembl VEP REST API](#) has come out of beta!

New in version 75 (February 2014)

- let Ensembl VEP pick one consequence per variant for you using `--pick`; includes all transcript-specific data
- [gene symbol](#) available in RefSeq cache and when using `--refseq`
- Installation and use of RefSeq cache improved - remember to use `--refseq` with your RefSeq cache!

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

New in version 74 (December 2013) you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- retrieve the [humDiv PolyPhen prediction](#) instead of humVar using [--humdiv](#)
- source for gene symbol available with [--symbol](#)

New in version 73 (August 2013)

- NHLBI-ESP frequencies available in cache ([--af esp](#))
- Pubmed IDs for cited existing variants available in cache ([--pubmed](#))
- [Convert your cache to use tabix](#) - much faster when retrieving co-located existing variants!
- The [installer](#) can now update the Ensembl VEP to the latest version and install [FASTA files](#)
- [--hgnc](#) replaced by [--symbol](#) for non-human compatibility
- HGVS strings are now part [URI-escaped](#) to avoid "=" sign clashes
- use [--allele number](#) to identify input alleles by their order in the VCF ALT field
- use [--total length](#) to give the total length of cDNA, CDS and protein sequences
- add data from VCF INFO fields when using [custom annotations](#)

New in version 72 (June 2013)

- Speed and stability improvements when using forking
- Filter Ensembl VEP results using [filter_vep.pl](#)

New in version 71 (April 2013)

- SIFT predictions now available for Chicken, Cow, Dog, Human, Mouse, Pig, Rat and Zebrafish
- View [summary statistics](#) for Ensembl VEP runs in [output]_summary.html
- Generate HTML output using [--html](#)
- Support for simple tab-delimited format for input of structural variant data
- Cache now contains clinical significance statuses from dbSNP for human variants
- **NOTE:** Ensembl VEP version numbers have now (from release 71) changed to match Ensembl release numbers.

New in version 2.8 (December 2012)

- Easily filter out common human variants with [--filter common](#)
- 1000 Genomes continental population frequencies now stored in cache files

New in version 2.7 (October 2012)

- build Ensembl VEP cache files offline from GTF and FASTA files
- support for using FASTA files for sequence lookup in HGVS notations in offline/cache modes

New in version 2.6 (July 2012)

- support for [structural variant](#) consequences
- Sequence Ontology (SO) consequence terms now default
- script runtime 3-4x faster when using [forking](#)
- 1000 Genomes global MAF available in cache files
- improved memory usage

New in version 2.5 (May 2012)

- SIFT and PolyPhen predictions now available for RefSeq transcripts
- retrieve cell type-specific regulatory consequences
- consequences can be retrieved based on a single individual's genotype in a VCF input file
- find overlapping structural variants
- Condol support removed from main script and moved to a plugin

New in version 2.4 (February 2012)

- This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)
- online mode and new installer script make it easy to use the Ensembl VEP without the usual dependencies
 - output columns can be changed using [--output](#)

- VCF output support expanded, can now carry all fields
- output affected exon and intron numbers with [--numbers](#)
- output overlapping protein domains using [--domains](#)
- enhanced support for LRGs
- plugins now work on variants called as intergenic

New in version 2.3 (December 2011)

- add custom annotations from tabix-indexed files (BED, GFF, GTF, VCF, bigWig)
- add new functionality to the Ensembl VEP with user-written plugins
- filter input on consequence type

New in version 2.2 (September 2011)

- SIFT, PolyPhen and Condel predictions and regulatory features now accessible from the [cache](#)
- support for calling consequences against [RefSeq](#) transcripts
- variant identifiers (e.g. dbSNP rsIDs) and [HGVS notations](#) supported as input format
- variants can now be [filtered](#) by frequency in HapMap and 1000 genomes populations
- script can be used to convert files between formats (Ensembl/VCF/Pileup/HGVS to Ensembl/VCF/Pileup)
- large amount of code moved to API modules to ensure consistency between web and script Ensembl VEP
- memory usage optimisations
- Ensembl VEP script moved to [ensembl-tools repo](#)
- Added [--canonical](#), [--per_gene](#) and [--no_intergenic](#) options

New in version 2.1 (June 2011)

- ability to use local file [cache](#) in place of or alongside connecting to an Ensembl database
- significant improvements to speed of script
- whole-genome mode now default (no disadvantage for smaller datasets)
- improved status output with progress bars
- regulatory region consequences now reinstated and improved
- modification to output file - Transcript column is now Feature, and is followed by a Feature_type column

New in version 2.0 (April 2011)

- support for SIFT, PolyPhen and Condel missense predictions in human
- per-allele and compound consequence types
- support for Sequence Ontology (SO) and NCBI consequence terms
- modified output format
 - support for new output fields in Extra column
 - header section contains information on database and software versions
 - codon change shown in output
 - CDS position shown in output
 - option to output Ensembl protein identifiers
 - option to output HGVS nomenclature for variants
- support for gzipped input files
- enhanced configuration options, including the ability to read configuration from a file
- verbose output now much more useful
- whole-genome mode now more stable
- finding existing co-located variations now ~5x faster

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

Requirements

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Ensembl VEP requires:

- **gcc, g++ and make**
- **Perl** version **5.22** or above recommended (tested on 5.22, 5.26, 5.32, 5.34, 5.38)
- **Perl** packages:
 - [Archive::Zip](#)
 - [DBD::mysql](#) (version <=4.050)
 - [DBI](#)

See [this guide](#) for more information on how to install perl modules.

[Additional libraries](#) can be installed for extra features and enhancements but they are not required to run Ensembl VEP in most of the use cases.

Ensembl VEP's INSTALL.pl script will install required components of Ensembl API for you, but Ensembl VEP may also be used with any pre-existing API installations you have, **provided their versions match the version of VEP you are using**.

Ensembl VEP is available in the following platforms:

- Linux (e.g., Ubuntu, Debian, Mint)
- [macOS](#)
-  [Windows](#) (requires a more involved installation process)

Ensembl VEP is also available as [Docker](#) and [Singularity](#) images, allowing to skip the complex installation steps.

Installation

Ensembl VEP's INSTALL.pl makes it easy to set up your environment for using the Ensembl VEP. It will download and configure a minimal set of the Ensembl API for use by the Ensembl VEP, and can also download [cache files](#), [FASTA files](#) and [plugins](#).

Run the following, and follow any prompts as they appear:

```
perl INSTALL.pl
```

[Additional non-essential components](#) and enhancements must be installed manually.

Software components installed

- [BioPerl](#)
- [ensembl](#)
- [ensembl-io](#)
- [ensembl-variation](#)
- [ensembl-funcgen](#)
- [Bio::DB::HTS](#)

If you already have the latest version of the API installed you do not need to run the installer, although it can be used to simply update your API version (with post-release patches applied), and retrieve cache and FASTA files. The installer downloads the API within the Ensembl VEP directory and will not affect any other Ensembl API installations.

The script will also attempt to install a Perl::XS module, [Bio::DB::HTS](#), for rapid access to bgzipped FASTA files. If this fails, you may add the --NO_HTSLIB flag when running the installer; Ensembl VEP will fall back to using Bio::DB::Fasta for this functionality ([more details](#)).

Running the installer

The installer is run on the command line as follows:

```
perl INSTALL.pl [options]
```

You should not need to add any options, but configuration of the installer is possible with the flags below. Options can also be set by exporting **environment variables** prefixed with `VEP_` before running the installer (for instance, `export VEP_NO_HTSLIB=1` and `export VEP_DIR_PLUGINS="/plugins"`).

Flag	Alternate	Description
<code>--ASSEMBLY</code>	<code>-y</code>	Assembly version to use when using <code>--AUTO</code> . Most species have only one assembly available on each software release; currently this is only required for human on release 76 onwards.
<code>--AUTO</code>	<code>-a</code>	Run installer without prompts. Use the following options to specify parts to install: ● a (API + Bio::DB::HTS/htslib) ● l (Bio::DB::HTS/htslib only) ● c (cache) ● f (FASTA) ● p (plugins) — Require the use of the <code>--PLUGINS</code> flag to list the plugin(s) to install. e.g. for API and cache: <pre>perl INSTALL.pl --AUTO ac</pre>
<code>--CACHE_VERSION</code> [version]		By default the installer will download the latest version of Ensembl VEP caches and FASTA files (currently 116). You can force the script to install a different version, but there is no guarantee that a version of the API will be compatible with a different version of the cache.
<code>--CACHEDIR</code> [dir]	<code>-c</code>	By default the script will install the cache files in the ".vep" subdirectory in your home area. This option configures where cache files are installed. The <code>--dir_cache</code> flag must be passed when running Ensembl VEP if a non-default cache directory is given: <pre>./vep --dir_cache [dir]</pre>
<code>--DESTDIR</code> [dir]	<code>-d</code>	By default the script will install the API modules in a subdirectory of the current directory named "Bio". Using this option you can configure where the Bio directory is created. If something other than the default is used, this directory must either be added to your PERL5LIB environment variable when running Ensembl VEP, or included using perl's <code>-I</code> flag: <pre>perl -I [dir] vep</pre>
<code>--NO_HTSLIB</code>	<code>-l</code>	Don't attempt to install Bio::DB::HTS/htslib
<code>--NO_TEST</code>		Don't run API tests - useful if you know a harmless failure will prevent continuation of the installer
<code>--NO_UPDATE</code>	<code>-n</code>	By default the script will check for new versions or updates of Ensembl VEP. Using this option will skip this check.
<code>--PLUGINS</code>	<code>-g</code>	Comma-separated list of plugins to install when using <code>--AUTO</code> . To install all available plugins, use <code>--PLUGINS all</code> . <pre># List the available plugins: perl INSTALL.pl -a p --PLUGINS list # Download/install all the available plugins: perl INSTALL.pl -a p --PLUGINS all # Download/install a defined list of plugins, e.g.: perl INSTALL.pl -a p --PLUGINS dbNSFP,CADD,G2P</pre>

<pre>-- -r PLUGINS_DIR [dir]</pre>	By default the script will install the plugins files in the "Plugins" subdirectory of the <code>--CACHEDIR</code> directory. This option configures where the plugins files are installed. The <code>--dir_plugins</code> flag must be passed when running Ensembl VEP if a non-default plugins directory is given: <pre>./vep --dir_plugins [dir]</pre>
<pre>-- -p PREFER_BIN</pre>	Use this if the installer fails with "out of memory" errors.
<pre>--SPECIES -s</pre>	Comma-separated list of species to install when using <code>--AUTO</code>. To install the RefSeq cache, add <code>"_refseq"</code> to the species name, e.g. <code>"homo_sapiens_refseq"</code>, or <code>"_merged"</code> to install the merged Ensembl/RefSeq cache. Remember to use <code>--refseq</code> or <code>--merged</code> when running the VEP with the relevant cache! Use <code>a11</code> to install data for all available species.
<pre>-- USE_HTTPS _PROTO</pre>	Download cache and FASTA file using HTTPs protocol instead of FTP. Useful for networks where FTP port is blocked by firewall.
<pre>-- GITHUBTOKEN</pre>	Set token to use for authentication when querying GitHub API. Authenticated user have increased rate-limit. NOTE: use token with read-only access.
<pre>--QUIET -q</pre>	Don't write any status output when using <code>--AUTO</code>.

Additional components

INSTALL.pl will set up the minimum requirements Ensembl VEP. Some features and enhancements, however, require the installation of additional components. Most are perl modules that are easily installed using cpanm; see [this guide](#) for more information on how to install perl modules.

Typically, you will use cpanm to install modules locally in your home directories; this shows how to set up a path for perl modules and install one there:

```
mkdir -p $HOME/cpanm
export PERL5LIB=$PERL5LIB:$HOME/cpanm/lib/perl5
cpanm -l $HOME/cpanm Set::IntervalTree
```

To make the change to `PERL5LIB` permanent, it is recommended to add the `export` line to your `$HOME/.bashrc` or `$HOME/.profile`.

- Additional features
 - [JSON](#) - required to produce [JSON format output](#)
 - [Set::IntervalTree](#) - used to find overlaps between entities in coordinate space. Required to use `--nearest`
 - [Bio::DB::BigFile](#) - required to use bigWig format [custom annotation files](#). See [Bio::DB::BigFile instructions](#).
- Speed enhancements - these modules can improve Ensembl VEP runtime
 - [PerlIO::gzip](#) - marginal gains in compressed file parsing as used by the Ensembl VEP cache
 - [ensembl-xs](#) - provides pre-compiled replacements for frequently used routines in Ensembl VEP. Requires manual installation, see [README](#) for details

Bio::DB::BigFile

In order for Ensembl VEP to be able to access bigWig format custom annotation files, the Bio::DB::BigFile perl module is required.

Installation involves downloading and compiling the [kent source tree](#). The current version of the kent source tree does not require root access. This website requires cookies, and the limited processing of your personal data in order to function. By using the site

1. Download and unzip you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

```
wget https://github.com/ucscGenomeBrowser/kent/archive/v335_base.tar.gz
tar xzf v335_base.tar.gz
```

2. Set up some environment variables; these are required only temporarily for this installation process

```
export KENT_SRC=$PWD/kent-335_base/src
export MACHTYPE=$(uname -m)
export CFLAGS="-fPIC"
export MYSQLINC=`mysql_config --include | sed -e 's/^-I//g'`
export MYSQLLIBS=`mysql_config --libs`
```

3. Modify kent build parameters

```
cd $KENT_SRC/lib
echo 'CFLAGS="-fPIC"' > ../inc/localEnvironment.mk
```

4. Build kent source

```
make clean && make
cd ../jkOwnLib
make clean && make
```

If either of these steps fail, you may have some missing dependencies. Known common missing dependencies are libpng and libssl; these may be installed, for example, with `apt-get` on Ubuntu. If you do not have sudo access you may have to ask your sysadmin to install any missing dependencies.

```
sudo apt-get install libpng-dev libssl-dev
```

On macOS you may use [brew](#); the openssl libraries also need to be symbolically linked to a different path:

```
brew install libpng openssl
cd /usr/local/include
ln -s ../opt/openssl/include/openssl .
cd -
```

5. On some systems (e.g. macOS), a compiled file is placed in a path that Bio::DB::BigFile cannot find. You can correct this with:

```
ln -s $KENT_SRC/lib/x86_64/* $KENT_SRC/lib/
```

6. We'll now use cpanm to install the perl module for Bio::DB::BigFile itself. See [above](#) for guidance on this. In this example we're going to install the module to a path within your home directory. In order to do this we must modify the paths that perl looks in to find modules by adding to the `PERL5LIB` environment module. To make this change permanent you must add the `export` line to your `$HOME/.bashrc` or `$HOME/.profile`.

```
mkdir -p $HOME/cpanm
export PERL5LIB=$PERL5LIB:$HOME/cpanm/lib/perl5
cpanm -l $HOME/cpanm Bio::DB::BigFile
```

If you are prompted for the path to the kent source tree, that means something didn't go right in the compilation above. Double check that `$KENT_SRC/lib/jkweb.a` exists and is not found instead at e.g. `$KENT_SRC/lib/x86_64/jkweb.a`. You may copy or link the file (and the other files in that directory) to the former path.

```
ln -s $KENT_SRC/lib/x86_64/* $KENT_SRC/lib/
```

7. You should now be able to successfully run the appropriate test in the Ensembl VEP package:

```
perl -Imodules t/AnnotationSource_File_BigWig.t
```

Installing Ensembl VEP on macOS is slightly trickier than other Linux-based systems, and will require additional dependencies. These instructions will guide you through the setup of **Perlbrew**, **Homebrew**, **MySQL** and other dependencies that will allow for a clean installation of Ensembl VEP on your macOS system.

These instructions have been tested on **macOS High Sierra (10.13)** and **macOS Sierra (10.12)**. Older versions may require additional tweaks, however we shall endeavour to keep these instructions up to date for future versions of MacOS.

Prerequisite Setup

List of prerequisites: **Xcode**, **GCC**, **Perlbrew**, **Cpanm**, **Homebrew**, **mysql**, **DBI**, **DBD::mysql** (version <=4.050)

Xcode and GCC

Ensembl VEP requires Xcode and GCC for installation purposes. Fortunately, recent versions of macOS will look for (and attempt to install if required) both of these when you run the following command:

```
gcc -v
```

Perlbrew

We recommend using Perlbrew to install a new version of Perl on your mac, to prevent messing with the vendor perl too much. This can be done with the following command:

```
curl -L http://install.perlbrew.pl | bash
echo 'source $HOME/perl5/perlbrew/etc/bashrc' >> ~/.bash_profile
```

At this point, PLEASE RESTART YOUR TERMINAL WINDOW to allow for the perlbrew changes to take effect.

We recommend installing Perl version **5.26.2** to run Ensembl VEP, and installing cpanm to handle the installation of perl modules. These steps can be completed with the commands:

```
perlbrew install -j 5 --as 5.26.2 --thread --64all -Duseshrplib perl-5.26.2 --notest
perlbrew switch 5.26.2
perlbrew install-cpanm
```

Homebrew

This package management system for macOS would make the installation of the next prerequisite (i.e. xs) easier.

```
/usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"
```

xz

Ensembl VEP requires the installation of xz, a data-compression utility. The easiest way to install the xz package is through homebrew:

```
brew install xz
```

MySQL

In order to connect to the Ensembl databases, a collection of MySQL related dependencies are required. Fortunately, these can be installed neatly with **Homebrew** and **Cpanm**:

```
brew install mysql
cpanm DBI
cpanm DBD::mysql@4.050
```

Installing BioPerl

On some versions of macOS, the Ensembl VEP installer fails to cleanly install BioPerl, so a manual install will prevent issues:

```
curl -O https://cpan.metacpan.org/authors/id/C/CJ/CJFIELD/BioPerl-1.6.924.tar.gz
tar zxvf BioPerl-1.6.924.tar.gz
```

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

```
echo 'export PERL5LIB=${PERL5LIB}##PATH_TO##/bioperl-1.6.924' >> ~/.bash_profile
```

where `##PATH_TO##/bioperl-1.6.924` refers to the location of the newly unzipped BioPerl directory.

Final Dependencies

Installing the following Perl modules with `cpanm` will allow for full Ensembl VEP functionality:

```
cpanm Test::Differences Test::Exception Test::Perl::Critic Archive::Zip PadWalker Error
Devel::Cycle Role::Tiny::With Module::Build LWP List::MoreUtils

export DYLD_LIBRARY_PATH=/usr/local/mysql/lib/:$DYLD_LIBRARY_PATH
```

Installing Ensembl VEP

And that should be that! You should now be able to install Ensembl VEP using the installer:

```
git clone https://github.com/ensembl/ensembl-vep
cd ensembl-vep
perl INSTALL.pl --NO_TEST
```

Using Ensembl VEP in Windows

Ensembl VEP was developed as a command-line tool, and as a Perl script its natural environment is a Linux system. However, there are several ways you can use Ensembl VEP on a Windows machine.

You may also consider using Ensembl VEP's web or REST interfaces.

Virtual machines

Using a virtual machine you can run a virtual Linux system in a window on your machine. There are two ways to do this:

1. Use the [Ensembl virtual machine image](#)
2. Use [Docker](#)

Perl

If Perl is installed on Windows, Ensembl VEP can be setup. However this may require installation of dependent modules. We recommend using [Docker](#) to run Ensembl VEP on Windows.

1. Check Perl is installed
2. Download and unpack the [zip of the ensembl-vep package](#)
3. Open a Command Prompt (search for Command Prompt in the Start Menu)
4. Navigate to the directory where you unpacked the Ensembl VEP package, e.g.

```
cd Downloads/ensembl-vep-release-116
```

5. Run `INSTALL.pl` with `--NO_HTSLIB` and `--NO_TEST`; you will see some warnings about the "which" command not being available (these will also appear when running Ensembl VEP and can be ignored).

```
perl INSTALL.pl --NO_HTSLIB --NO_TEST
```

Docker

[Docker](#) allows running applications in virtualised *containers*. The Ensembl VEP Docker image is available from [Docker Hub](#).

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#).

```
docker pull ensemblorg/ensembl-vep
```

To download cache files and other data with Ensembl VEP Docker, we recommend [mounting a directory](#) from your local (host) machine to folder `/data` from the Docker image. For instance:

```
mkdir $HOME/vep_data
docker run -t -i -v $HOME/vep_data:/data ensemblorg/ensembl-vep
```

In the example above, data in `$HOME/vep_data` will be accessible by both the local machine and Ensembl VEP Docker. The Ensembl VEP API, plugins maintained by Ensembl VEP and their dependencies (e.g. Perl APIs, Bio::DB::HTS, htlib, ...) are already installed in the image.

Cache and FASTA files installation

You can run the `INSTALL.pl` script to install the cache and FASTA files:

```
docker run -t -i -v $HOME/vep_data:/data ensemblorg/ensembl-vep INSTALL.pl
```

- You will be asked to install cache data. Type the comma-separated numbers for the species/assembly of interest and press `enter`. Your data will download and unpack; this may take a while.
- If you wish to retrieve HGVS annotations, please download the FASTA files for your species. To do this, at the next prompt type `0` and press `enter`.

The above process may also be performed in one command; for example, to set up the cache and corresponding FASTA for human GRCh38:

```
docker run -t -i -v $HOME/vep_data:/data ensemblorg/ensembl-vep INSTALL.pl -a cf -s homo_sapiens -y GRCh38
```

The installer downloads Ensembl VEP data to the mounted directory (e.g., `$HOME/vep_data`). The downloaded data will be automatically detected as long as its folder is mounted when running VEP:

```
docker run -v $HOME/vep_data:/data ensemblorg/ensembl-vep vep -i examples/homo_sapiens_GRCh38.vcf --cache
```

Running Ensembl VEP with data from local folder

Here is an example on running Ensembl VEP with data from folder `$HOME/vep_data` in the local machine (provided that the cache has been downloaded to that folder):

```
docker run -v $HOME/vep_data:/data ensemblorg/ensembl-vep \
vep --cache --offline --format vcf --vcf --force_overwrite \
--input_file input/my_input.vcf \
--output_file output/my_output.vcf \
--custom_file=custom/my_extra_data.bed,short_name=BED_DATA,format=bed,type=exact,coords=1 \
--plugin NMD
```

Please avoid using absolute paths to data as the paths inside the container differ from your local machine.

Update from a previous version

1. Update your Docker container

```
docker pull ensemblorg/ensembl-vep
```

2. Update your cache

This website requires cookies, and the limited processing of your personal data in order to function. By using the site (see the [section above](#)) you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#).

```
# Or install the cache manually
cd $HOME/vep_data
curl -O https://ftp.ensembl.org/pub/release-
116/variation/vep/homo_sapiens_vep_116_GRCh38.tar.gz
tar xzf homo_sapiens_vep_116_GRCh38.tar.gz
```

Singularity

Due to root requirements for the Docker daemon, using the [Docker container for Ensembl VEP](#) is not always possible to HPC users. Singularity, an alternative containerisation tool, does not assume that you have a system where you are the root user. This has led to increased popularity in HPC contexts due to increased access rights flexibility.

After installing [Singularity](#), Ensembl VEP may be used with Singularity based on the VEP Docker image from DockerHub:

```
singularity pull --name vep.sif docker://ensemblorg/ensembl-vep
```

The following is a brief example showing how to use a directory on your local (host) machine to store cache data for VEP.

```
mkdir $HOME/vep_data
singularity exec vep.sif vep --dir $HOME/vep_data --help
```

The Ensembl VEP API, plugins and their dependencies (e.g. Perl APIs, Bio::DB::HTS, htlib, ...) are already installed in the image.

Cache and FASTA files installation

You can run the INSTALL.pl script to install the Cache data and FASTA files. For example, to set up the cache and corresponding FASTA for human GRCh38 in your local folder `$HOME/vep_data`:

```
singularity exec vep.sif INSTALL.pl -c $HOME/vep_data -a cf -s homo_sapiens -y GRCh38
```

The installer downloads data to the specified directory (e.g., `$HOME/vep_data`). When running Ensembl VEP via Singularity, point to this directory using `--dir`:

```
singularity exec vep.sif vep --dir $HOME/vep_data -i examples/homo_sapiens_GRCh38.vcf --cache
```

Running Ensembl VEP with data from local folder

Here is an example on running Ensembl VEP with data from folder `$HOME/vep_data` in the local machine (provided that the cache has been downloaded to that folder):

```
singularity exec vep.sif \
vep --dir $HOME/vep_data \
--cache --offline --format vcf --vcf --force_overwrite \
--input_file input/my_input.vcf \
--output_file output/my_output.vcf \
--custom file=custom/my_extra_data.bed,short_name=BED_DATA,format=bed,type=exact,coords=1 \
--plugin NMD
```

Update from a previous version

1. Update your docker container

```
singularity pull --name vep.sif docker://ensemblorg/ensembl-vep
```

2. Update your cache

This website requires cookies, and the limited processing of your personal data in order to function. By using the site (above) you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

```
# Or install the cache manually
cd $HOME/vep_data
curl -O https://ftp.ensembl.org/pub/release-
116/variation/vep/homo_sapiens_vep_116_GRCh38.tar.gz
tar xzf homo_sapiens_vep_116_GRCh38.tar.gz
```

Nextflow

We offer a [Nextflow Ensembl VEP pipeline](#) that aims to run Ensembl VEP using simple parallelisation. The pipeline is deployable on an individual Linux machine or on computing clusters running LSF, SLURM or other workload managers.

The process can be summarised briefly by the following steps:

- Splitting the input data into multiple files using a given number of bins
- Running Ensembl VEP on the split files in parallel
- Merging Ensembl VEP outputs into a single file

To run the pipeline in a system with [Nextflow](#) installed, you will need to prepare a [vep.ini config file](#). Here are some examples commands to run the Nextflow Ensembl VEP pipeline:

```
# Run Nextflow Ensembl VEP using local Ensembl VEP installation
# NB: Nextflow automatically downloads the GitHub repository
nextflow run Ensembl/ensembl-vep -r main \
  --input input.vcf \
  --vep_config vep.ini

# Run latest Ensembl VEP version using Docker
nextflow run Ensembl/ensembl-vep -r main \
  -profile docker \
  --input input.vcf \
  --vep_config vep.ini

# Run Ensembl VEP 116.0 using Docker
nextflow run Ensembl/ensembl-vep -r main \
  -profile docker \
  --input input.vcf \
  --vep_config vep.ini \
  --vep_version 116.0

# Run Ensembl VEP 116.0 using SLURM and Singularity
nextflow run Ensembl/ensembl-vep -r main \
  -profile slurm,singularity \
  --input input.vcf \
  --vep_config vep.ini \
  --vep_version 116.0
```

For a full list of supported profiles, as well as more instructions on setting up and running the pipeline, please refer to the [Nextflow Ensembl VEP instructions](#).

Input

Both the web and command line interfaces to Ensembl VEP can use the same input formats.

Supported input formats:

Format	Variant example	Structural variant example
Default Ensembl VEP input	1 881907 881906 -/C +	1 160283 471362 DUP +
VCF	1 65568 . A C . . .	1 7936271 . N N[12:58877476[. . SVTYPE=BND
HGVS identifiers	ENST00000618231.3:c.9G>C	X Not supported
Variant identifiers	rs699	nsv1000164
Genomic SPDI notation	NC_000016.10:68684738:G:A	X Not supported
REST-style regions	14:19584687-19584687:-1/T	21:25587759-25587769/DEL

Default Ensembl VEP input

The default format is a simple **whitespace-separated** format (columns may be separated by space or tab characters), containing five required columns plus an optional identifier column:

- chromosome** - just the name or number, with no 'chr' prefix
- start**
- end**
- allele** - pair of alleles separated by a '/', with the reference allele first (or [structural variant type](#)).
- strand** - defined as + (forward) or - (reverse). The alleles will be reverse complemented for mapping to the genome if the minus strand is provided.
- identifier** - this identifier will be used the output. If not provided, Ensembl VEP will construct an identifier from the given coordinates and alleles.

1	881907	881906	-/C	+	
2	946507	946507	G/C	+	
5	140532	140532	T/C	+	
8	150029	150029	A/T	+	var2
12	1017956	1017956	T/A	+	
14	19584687	19584687	C/T	-	
19	66520	66520	G/A	+	var1

An insertion (of any size) is indicated by start coordinate = end coordinate + 1. For example, an insertion of 'C' between nucleotides 12600 and 12601 on the forward strand of chromosome 8 is indicated as follows:

8	12601	12600	-/C	+	
---	-------	-------	-----	---	--

A deletion is indicated by the exact nucleotide coordinates. For example, a three base pair deletion of nucleotides 12600, 12601, and 12602 of the reverse strand of chromosome 8 will be:

8	12600	12602	CGT/-	-	
---	-------	-------	-------	---	--

Structural variants are also supported by indicating a [structural variant type](#) instead of the allele:

1	20000	30000	CN4	+	cnv4
1	160283	471362	DUP	+	dup

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

12	1017956	1017956	INV	+	inv
21	25587759	25587769	CN0	+	del2

VCF

[VCF \(Variant Call Format\) version 4.0](#) is supported. This is a common format produced by many variant calling tools and is the recommended format for use with Ensembl VEP:

#CHROM	POS	ID	REF	ALT	QUAL	FILTER	INFO	FORMAT
1	65568	.	A	C	.	.	.	.
1	230710048	rs699	A	G	.	.	.	.
2	265023	.	C	T	.	.	.	.
3	319780	.	GA	G	.	.	.	.
20	3	.	C	CAAG, CAAGAAG	.	PASS	.	.
21	43762120	rs1300	T	A, C, G	.	.	.	.

Structural variants are also supported depending on [structural variant type](#).

Users using VCF should note a peculiarity in the difference between how Ensembl and VCF describe unbalanced variants. For any unbalanced variant (i.e. insertion, deletion or unbalanced substitution), the VCF specification requires that the base immediately before the variant should be included in both the reference and variant alleles. This also affects the reported position i.e. the reported position will be one base before the actual site of the variant.

In order to parse this correctly, Ensembl VEP needs to convert such variants into Ensembl-type coordinates, and it does this by removing the additional base and adjusting the coordinates accordingly. This means that if an identifier is not supplied for a variant (in the 3rd column of the VCF), then the identifier constructed and the position reported in Ensembl VEP output file will differ from the input.

This problem can be overcome with the following:

1. ensuring each variant has a unique identifier specified in the 3rd column of the VCF
2. using VCF format as output (`--vcf`) - this preserves the formatting of your input coordinates and alleles
3. using `--minimal` and `--allele_number` (see [Complex VCF entries](#)).

The following examples illustrate how VCF describes a variant and how it is handled internally by Ensembl VEP. Consider the following aligned sequences (for the purposes of discussion on chromosome 20):

```
Ref: a t C g a // C is the reference base
1 : a t G g a // C base is a G in individual 1
2 : a t - g a // C base is deleted w.r.t. the reference in individual 2
3 : a t CAg a // A base is inserted w.r.t. the reference sequence in individual 3
```

Individual 1

The first individual shows a simple balanced substitution of G for C at base 3. This is described in a compatible manner in VCF and Ensembl styles. Firstly, in VCF:

20	3	.	C	G	.	PASS	.
----	---	---	---	---	---	------	---

And in Ensembl format:

20	3	3	C/G	+
----	---	---	-----	---

Individual 2

The second individual has the 3rd base deleted relative to the reference. In VCF, both the reference and variant allele columns must include the preceding base (T) and the reported position is that of the preceding base:

20	2	.	TC	T	.	PASS	.
----	---	---	----	---	---	------	---

```
20 3 3 C/- +
```

The upshot of this is that while in the VCF input file the position of the variant is reported as 2, in the output file in Ensembl VEP default format the position will be reported as 3. If no identifier is provided in the third column of the VCF, then the constructed identifier will be:

```
20_3_C/-
```

Individual 3

The third individual has an "A" inserted between the 3rd and 4th bases of the sequence relative to the reference. In VCF, as for the deletion, the base before the insertion is included in both the reference and variant allele columns, and the reported position is that of the preceding base:

```
20 3 . C CA . PASS .
```

In Ensembl format, again the preceding base is not included, and the start/end positions are "swapped" to indicate that this is an insertion. Similarly to a deletion, a "-" is used to indicate no sequence in the reference:

```
20 4 3 -/A +
```

Again, the output will appear different, and the constructed identifier may not be what is expected:

```
20_3_-/A
```

Using VCF format output, or adding unique identifiers to the input (in the third VCF column), can mitigate this issue.

Complex VCF entries

For VCF entries with multiple alternate alleles, Ensembl VEP will only trim the leading base from alleles if **all** REF and ALT alleles start with the same base:

```
20 3 . C CAAG,CAAGAAG . PASS .
```

This will be considered internally by Ensembl VEP as equivalent to:

```
20 4 3 -/AAG/AAGAAG +
```

Now consider the case where a single VCF line contains a representation of both a SNV and an insertion:

```
20 3 . C CAAAG,G . PASS .
```

Here the input alleles will remain unchanged, and Ensembl VEP will consider the first REF/ALT pair as a substitution of C for CAAG, and the second as a C/G SNV:

```
20 3 3 C/CAAG/G +
```

To modify this behaviour, with the commandline tool you can use `--minimal`. This flag forces Ensembl VEP to consider each REF/ALT pair independently, trimming identical leading and trailing bases from each as appropriate. Since this can lead to confusing output regarding coordinates etc, it is not the default behaviour. It is recommended to use the `--allele number` flag to track the correspondence between alleles as input and how they appear in the output.

HGVS identifiers

See <https://varnomen.hgvs.org> for details. These must be relative to genomic or Ensembl transcript coordinates.

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

Examples: you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

```
ENST00000618231.3:c.9G>C
ENST00000471631.1:c.28_33delTCGCGG
ENST00000285667.3:c.1047_1048insC
5:g.140532G>C
```

Examples using RefSeq identifiers (using [--refseq](#) in the command line or select the 'RefSeq transcripts' on the web interface:

```
NM_153681.2:c.7C>T
NM_005239.6:c.190G>A
NM_001025204.2:c.336G>A
```

HGVS protein notations may also be used, provided that they unambiguously map to a single genomic change. Due to redundancy in the amino acid code, it is not always possible to work out the corresponding genomic sequence change for a given protein sequence change. The following example is for a permissible protein notation in dog (*Canis familiaris*):

```
ENSCAFP00000040171.1:p.Thr92Asn
```

Ambiguous gene-based descriptions

It is possible to use ambiguous descriptions listing only gene symbol or UniProt accession and protein change (e.g. PHF21B:p.Tyr124Cys, P01019:p.Ala268Val), as seen in the literature, though this is not recommended as it can produce multiple different variants at genomic level. The transcripts for a gene are considered in the following order:

1. [MANE Select transcript status](#)
2. [MANE Plus Clinical transcript status](#)
3. canonical status of transcript
4. [APPRIS isoform annotation](#)
5. [transcript support level](#)
6. biotype of transcript ("protein_coding" preferred)
7. CCDS status of transcript
8. consequence rank according to [this table](#)
9. translated, transcript or feature length (longer preferred)

and the first compatible transcript is used to map variants to the genome for annotation.

Variant identifiers

These should be dbSNP rsIDs (such as `rs699`), or any synonym for a variant present in the Ensembl Variation database. Structural variant identifiers (like `nsv1000164` and `esv1850194`) are also supported.

See [here](#) for a list of identifier sources in Ensembl.

Examples:

```
rs1156485833
rs1258750482
rs867704559
esv1815690
nsv1000164
```

Genomic SPDI notation

Genomic SPDI notation which uses four fields delimited by colons S:P:D:I (Sequence:Position:Deletion:Insertion) is also supported. In SPDI notation, the position refers to the base before the variant, not the base of the variant itself.

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#).

Examples:

```
NC_000016.10:68684738:G:A
NC_000017.11:43092199:GCTTTT:
NC_000013.11:32315789::C
NC_000016.10:68644746:AA:GTA
16:68684738:2:AC
```

REST-style regions

The Ensembl VEP region REST endpoint requires variants are described as `[chr]:[start]-[end]:[strand]/[allele]`.

This follows the same conventions as the [default input format](#), with the key difference being that this format does not require the reference (REF) allele to be included; this will be looked up using either a provided FASTA file (preferred) or Ensembl core database. Strand is optional and defaults to 1 (forward strand).

```
# SNP
5:140532-140532:1/C

# SNP (reverse strand)
14:19584687-19584687:-1/T

# insertion
1:881907-881906:1/C

# 5bp deletion
2:946507-946511:1/-
```

Structural variants are also supported by indicating a [structural variant type](#) in the place of the `[allele]`:

```
# structural variant: deletion
21:25587759-25587769/DEL

# structural variant: inversion
21:25587759-25587769/INV
```

Structural variant types

Ensembl VEP also predicts molecular consequences for structural variants using the following input formats:

- [Default Ensembl VEP input](#)
- [REST-style regions](#)
- [Variant identifiers](#)
- [VCF](#)

To recognise a variant as a structural variant, the allele string (or `SVTYPE` in the INFO column of the VCF format) must be set to one of the currently supported values:

- **INS** - insertion
 - **INS:ME** - insertion of mobile element
 - **INS:ME:ALU** - insertion of ALU element
 - **INS:ME:HERV** - insertion of HERV element
 - **INS:ME:LINE1** - insertion of LINE1 element

- **INS:ME:SVA** - insertion of SVA element

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

- **DEL** - deletion

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- **DEL:ME** - deletion of mobile element

- **DEL:ME:ALU** - deletion of ALU element
- **DEL:ME:HERV** - deletion of HERV element
- **DEL:ME:LINE1** - deletion of LINE1 element
- **DEL:ME:SVA** - deletion of SVA element
- **DUP** - duplication
 - **DUP:TANDEM** - tandem duplication
 - **TDUP** - tandem duplication
- **INV** - inversion
- **CNV** - copy number variation
 - The copy number value can be specified like so:
 - CN0
 - CN=4
 - CN3, CN4, CN6
 - CN=0, CN=2, CN=4
 - **CNV:TR** - tandem repeats
 - Requires **INFO** fields describing the tandem repeat, such as **RUS** and **RN** – check [VCF 4.4 specification, section 5.7](#)
 - Currently, the **CIRUC** and **CIRB INFO** fields are ignored when calculating alternative alleles in tandem repeats
- **BND** - chromosome breakpoints
 - Breakpoint variants are composed by one or more breakends
 - In VCF, breakend replacements are inserted into the **ALT** column and need to meet the [HTS specifications](#), such as TG[12:58877476[
 - Single breakends can be specified in **ALT**, such as T. and .G
 - Multiple, comma-separated alternative breakends can be specified in **ALT**, such as A[22:22893780[,A[X:10932343[
 - Breakends are only supported for VCF input format

More information on how Ensembl VEP processes structural variants can be found [here](#).

Examples of structural variants encoded in VCF format

#CHROM	POS	ID	REF	ALT	QUAL	FILTER	INFO
1	160283	dup	.	<DUP>	.	.	SVTYPE=DUP;END=471362
1	1385015	del	.		.	.	SVTYPE=DEL;END=1387562
1	7936271	bnd	N	N[12:58877476[	.	.	SVTYPE=BND

See the [VCF definition document](#) for more detail on how to describe structural variants in VCF format.

Output

Ensembl VEP can return the results in different formats:

- [Default Ensembl VEP output](#)
- [Tab-delimited output](#)
- [VCF](#)
- [JSON output](#)

Along with the results Ensembl VEP computes and returns some [statistics](#).

The default output format ("VEP" format when downloading from the web interface) is a 14 column tab-delimited file. Empty values are denoted by '.'. The output columns are:

1. **Uploaded variation** - as chromosome_start_alleles
2. **Location** - in standard coordinate format (chr:start or chr:start-end)
3. **Allele** - the variant allele used to calculate the consequence
4. **Gene** - Ensembl stable ID of affected gene
5. **Feature** - Ensembl stable ID of feature
6. **Feature type** - type of feature. Currently one of Transcript, RegulatoryFeature, MotifFeature.
7. **Consequence** - [consequence type](#) of this variant
8. **Position in cDNA** - relative position of base pair in cDNA sequence
9. **Position in CDS** - relative position of base pair in coding sequence
10. **Position in protein** - relative position of amino acid in protein
11. **Amino acid change** - only given if the variant affects the protein-coding sequence
12. **Codon change** - the alternative codons with the variant base in upper case
13. **Co-located variation** - identifier of any [existing variants](#). Switch on with [--check_existing](#)
14. **Extra** - this column contains extra information as key=value pairs separated by ";", see below.

Other output fields:

- **REF_ALLELE** - the reference allele (after minimisation)
- **UPLOADED_ALLELE** - the uploaded allele string (before minimisation)
- **IMPACT** - the impact modifier for the consequence type
- **VARIANT_CLASS** - Sequence Ontology [variant class](#)
- **SYMBOL** - the gene symbol
- **SYMBOL_SOURCE** - the source of the gene symbol
- **STRAND** - the DNA strand (1 or -1) on which the transcript/feature lies
- **ENSP** - the Ensembl protein identifier of the affected transcript
- **FLAGS** - transcript quality flags:
 - *cds_start_NF*: CDS 5' incomplete
 - *cds_end_NF*: CDS 3' incomplete
- **SWISSPROT** - Best match UniProtKB/Swiss-Prot accession of protein product
- **TREMBL** - Best match UniProtKB/TrEMBL accession of protein product
- **UNIPARC** - Best match UniParc accession of protein product
- **HGVSc** - the HGVS coding sequence name
- **HGVSp** - the HGVS protein sequence name
- **HGVSG** - the HGVS genomic sequence name
- **HGVS_OFFSET** - Indicates by how many bases the HGVS notations for this variant have been [shifted](#). Value must be greater than 0.
- **NEAREST** - Identifier(s) of nearest transcription start site
- **SIFT** - the SIFT prediction and/or score, with both given as prediction(score)
- **PolyPhen** - the PolyPhen prediction and/or score
- **MOTIF_NAME** - the source and identifier of a transcription factor binding profile aligned at this position
- **MOTIF_POS** - The relative position of the variation in the aligned TFBP
- **HIGH_INF_POS** - a flag indicating if the variant falls in a high information position of a transcription factor binding profile (TFBP)
- **MOTIF_SCORE_CHANGE** - The difference in motif score of the reference and variant sequences for the TFBP

● **CELL_TYPE** - List of cell types and classifications for regulatory feature

- This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)
- **CANONICAL** - a flag indicating if the transcript is denoted as the canonical transcript for this gene
 - **CCDS** - the CCDS identifier for this transcript, where applicable

- **INTRON** - the intron number (out of total number)
- **EXON** - the exon number (out of total number)
- **DOMAINS** - the source and identifier of any overlapping protein domains
- **DISTANCE** - Shortest distance from variant to transcript. *Note: DISTANCE of 0 is possible for insertions happening just before or after a transcript because variant coordinates are considered to be the flanking bases where insertion happens.*
- **IND** - individual name
- **ZYG** - zygosity of individual genotype at this locus
- **SV** - IDs of overlapping structural variants
- **FREQS** - Frequencies of overlapping variants used in filtering
- **AF** - Frequency of existing variant in 1000 Genomes
- **AFR_AF** - Frequency of existing variant in 1000 Genomes combined African population
- **AMR_AF** - Frequency of existing variant in 1000 Genomes combined American population
- **ASN_AF** - Frequency of existing variant in 1000 Genomes combined Asian population
- **EUR_AF** - Frequency of existing variant in 1000 Genomes combined European population
- **EAS_AF** - Frequency of existing variant in 1000 Genomes combined East Asian population
- **SAS_AF** - Frequency of existing variant in 1000 Genomes combined South Asian population
- **gnomADe_AF** - Frequency of existing variant in gnomAD exomes combined population
- **gnomADe_AFR_AF** - Frequency of existing variant in gnomAD exomes African/American population
- **gnomADe_AMR_AF** - Frequency of existing variant in gnomAD exomes American population
- **gnomADe_ASJ_AF** - Frequency of existing variant in gnomAD exomes Ashkenazi Jewish population
- **gnomADe_EAS_AF** - Frequency of existing variant in gnomAD exomes East Asian population
- **gnomADe_FIN_AF** - Frequency of existing variant in gnomAD exomes Finnish population
- **gnomADg_MID_AF** - Frequency of existing variant in gnomAD exomes Mid-eastern population
- **gnomADe_NFE_AF** - Frequency of existing variant in gnomAD exomes Non-Finnish European population
- **gnomADe_REMAINING_AF** - Frequency of existing variant in gnomAD exomes combined remaining combined populations
- **gnomADe_SAS_AF** - Frequency of existing variant in gnomAD exomes South Asian population
- **gnomADg_AF** - Frequency of existing variant in gnomAD genomes combined population
- **gnomADg_AFR_AF** - Frequency of existing variant in gnomAD genomes African/American population
- **gnomADg_AMI_AF** - Frequency of existing variant in gnomAD genomes Amish population
- **gnomADg_AMR_AF** - Frequency of existing variant in gnomAD genomes American population
- **gnomADg_ASJ_AF** - Frequency of existing variant in gnomAD genomes Ashkenazi Jewish population
- **gnomADg_EAS_AF** - Frequency of existing variant in gnomAD genomes East Asian population
- **gnomADg_FIN_AF** - Frequency of existing variant in gnomAD genomes Finnish population
- **gnomADg_MID_AF** - Frequency of existing variant in gnomAD genomes Mid-eastern population
- **gnomADg_NFE_AF** - Frequency of existing variant in gnomAD genomes Non-Finnish European population
- **gnomADg_REMAINING_AF** - Frequency of existing variant in gnomAD genomes combined remaining combined populations
- **gnomADg_SAS_AF** - Frequency of existing variant in gnomAD genomes South Asian population
- **MAX_AF** - Maximum observed allele frequency in 1000 Genomes, ESP and gnomAD
- **MAX_AF_POPS** - Populations in which maximum allele frequency was observed
- **CLIN_SIG** - ClinVar clinical significance of the dbSNP variant
- **BIOTYPE** - Biotype of transcript or regulatory feature
- **APPRIS** - Annotates alternatively spliced transcripts as primary or alternate based on a range of computational methods. NB: not available for GRCh37
- **TSL** - Transcript support level. NB: not available for GRCh37
- **GENCODE_PRIMARY** - Reports if transcript belongs to GENCODE primary subset

- **PHENO** - Indicates if existing variant is associated with a phenotype, disease or trait; multiple values correspond to multiple values in the Existing_variation field
- **GENE_PHENO** - Indicates if overlapped gene is associated with a phenotype, disease or trait
- **ALLELE_NUM** - Allele number from input; 0 is reference, 1 is first alternate etc
- **MINIMISED** - Alleles in this variant have been converted to minimal representation before consequence calculation
- **PICK** - indicates if this block of consequence data was picked by [--flag_pick](#) or [--flag_pick allele](#)
- **BAM_EDIT** - Indicates success or failure of edit using BAM file
- **GIVEN_REF** - Reference allele from input
- **USED_REF** - Reference allele as used to get consequences
- **REFSEQ_MATCH** - the RefSeq transcript match status; contains a number of flags indicating whether this RefSeq transcript matches the underlying reference sequence and/or an Ensembl transcript ([more information](#)).
 - *rseq_3p_mismatch*: signifies a mismatch between the RefSeq transcript and the underlying primary genome assembly sequence. Specifically, there is a mismatch in the 3' UTR of the RefSeq model with respect to the primary genome assembly (e.g. GRCh37/GRCh38).
 - *rseq_5p_mismatch*: signifies a mismatch between the RefSeq transcript and the underlying primary genome assembly sequence. Specifically, there is a mismatch in the 5' UTR of the RefSeq model with respect to the primary genome assembly.
 - *rseq_cds_mismatch*: signifies a mismatch between the RefSeq transcript and the underlying primary genome assembly sequence. Specifically, there is a mismatch in the CDS of the RefSeq model with respect to the primary genome assembly.
 - *rseq_ens_match_cds*: signifies that for the RefSeq transcript there is an overlapping Ensembl model that is identical across the CDS region only. A CDS match is defined as follows: the CDS and peptide sequences are identical and the genomic coordinates of every translatable exon match. Useful related attributes are: *rseq_ens_match_wt* and *rseq_ens_no_match*.
 - *rseq_ens_match_wt*: signifies that for the RefSeq transcript there is an overlapping Ensembl model that is identical across the whole transcript. A whole transcript match is defined as follows: 1) In the case that both models are coding, the transcript, CDS and peptide sequences are all identical and the genomic coordinates of every exon match. 2) In the case that both transcripts are non-coding the transcript sequences and the genomic coordinates of every exon are identical. No comparison is made between a coding and a non-coding transcript. Useful related attributes are: *rseq_ens_match_cds* and *rseq_ens_no_match*.
 - *rseq_ens_no_match*: signifies that for the RefSeq transcript there is no overlapping Ensembl model that is identical across either the whole transcript or the CDS. This is caused by differences between the transcript, CDS or peptide sequences or between the exon genomic coordinates. Useful related attributes are: *rseq_ens_match_wt* and *rseq_ens_match_cds*.
 - *rseq_mrna_match*: signifies an exact match between the RefSeq transcript and the underlying primary genome assembly sequence (based on a match between the transcript stable id and an accession in the RefSeq mRNA file). An exact match occurs when the underlying genomic sequence of the model can be perfectly aligned to the mRNA sequence post polyA clipping.
 - *rseq_mrna_nonmatch*: signifies a non-match between the RefSeq transcript and the underlying primary genome assembly sequence. A non-match is deemed to have occurred if the underlying genomic sequence does not have a perfect alignment to the mRNA sequence post polyA clipping. It can also signify that no comparison was possible as the model stable id may not have had a corresponding entry in the RefSeq mRNA file (sometimes happens when accessions are retired or changed). When a non-match occurs one or several of the following transcript attributes will also be present to provide more detail on the nature of the non-match: *rseq_5p_mismatch*, *rseq_cds_mismatch*, *rseq_3p_mismatch*, *rseq_nctran_mismatch*, *rseq_no_comparison*
 - *rseq_nctran_mismatch*: signifies a mismatch between the RefSeq transcript and the underlying primary genome assembly sequence. This is a comparison between the entire underlying genomic sequence of the RefSeq model to the mRNA in the case of RefSeq models that are non-coding.
 - *rseq_no_comparison*: signifies that no alignment was carried out between the underlying primary genome assembly sequence and a corresponding RefSeq mRNA. The reason for this is generally that no corresponding, unversioned accession was found in the RefSeq mRNA file for the transcript stable id. This sometimes happens when accessions are retired or replaced. A second possibility is that the sequences were too long and problematic to align (though this is rare).
- **OverlapBP** - Number of base pairs overlapping with the corresponding structural variation feature
- **OverlapPC** - Percentage of corresponding structural variation feature overlapped by the given input
- **CHECK_REF** - Reports variants where the input reference does not match the expected reference
- **AMBIGUITY** - IUPAC allele ambiguity code

Example of Ensembl VEP default output format:

The Ensembl VEP command line tool will also add a header to the output file. This contains information about the databases connected to, and also a key describing the key/value pairs used in the extra column.

```

## ENSEMBL VARIANT EFFECT PREDICTOR v116.0
## Output produced at 2017-03-21 14:51:27
## Connected to homo_sapiens_core_116_38 on ensembl.org
## Using cache in /homes/user/.vep/homo_sapiens/116_GRCh38
## Using API version 116, DB version 116
## polyphen version 2.2.2
## sift version sift5.2.2
## COSMIC version 78
## ESP version 20141103
## gencode version GENCODE 25
## genebuild version 2014-07
## HGMD-PUBLIC version 20162
## regbuild version 16
## assembly version GRCh38.p7
## ClinVar version 201610
## dbSNP version 147
## Column descriptions:
## Uploaded_variation : Identifier of uploaded variant
## Location : Location of variant in standard coordinate format (chr:start or chr:start-end)
## Allele : The variant allele used to calculate the consequence
## Gene : Stable ID of affected gene
## Feature : Stable ID of feature
## Feature_type : Type of feature - Transcript, RegulatoryFeature or MotifFeature
## Consequence : Consequence type
## cDNA_position : Relative position of base pair in cDNA sequence
## CDS_position : Relative position of base pair in coding sequence
## Protein_position : Relative position of amino acid in protein
## Amino_acids : Reference and variant amino acids
## Codons : Reference and variant codon sequence
## Existing_variation : Identifier(s) of co-located known variants
## Extra column keys:
## IMPACT : Subjective impact classification of consequence type
## DISTANCE : Shortest distance from variant to transcript
## STRAND : Strand of the feature (1/-1)
## FLAGS : Transcript quality flags

```

Tab-delimited output

The `--tab` specifies a tab-delimited output file.

This differs from the default output format in that each individual field from the "Extra" field is written to a separate tab-delimited column.

This makes the output more suitable for import into spreadsheet programs such as Excel.

Furthermore the header is the same as the one for the Ensembl VEP default output format and this is also the format used when selecting the "TXT" option on the Ensembl VEP web interface.

Example of tab-delimited output format:

```

#Uploaded_variation    Location    Allele    Gene    Feature    Feature_type
Consequence            cDNA_position    CDS_position    Protein_position    Amino_acids

```

The choice and order of columns in the output may be configured using [--fields](#). For instance:

```
./vep -i examples/homo_sapiens_GRCh38.vcf --cache --force_overwrite --tab --fields "Uploaded
variation,Location,Allele,Gene"
```

VCF output

The Ensembl VEP commandline tool can also generate VCF output using the [--vcf](#) flag.

Main information about the VCF output format:

- Consequences are added in the INFO field of the VCF file, using the key "**CSQ**" (you can change it using [--vcf_info_field](#)).
- Data fields are encoded separated by the character "|" (pipe). The order of fields is written in the VCF header. Unpopulated fields are represented by an empty string.
- Output fields in the "CSQ" INFO field can be configured by using [--fields](#).
- Each prediction, for a given variant, is separated by the character "," in the CSQ INFO field (e.g. when a variant overlaps more than 1 transcript)

Here is a list of the (default) fields you can find within the CSQ field:

```

Allele|Consequence|IMPACT|SYMBOL|Gene|Feature_type|Feature|BIOTYPE|EXON|INTRON|HGVSc|HGVSp|cDNA_po
sition|CDS_position|Protein_position|Amino_acids|Codons|Existing_variation|DISTANCE|STRAND|FLAGS|S
YMBOL_SOURCE|HGNC_ID

```

Example command using the [--vcf](#) and [--fields](#) options:

```
./vep -i examples/homo_sapiens_GRCh38.vcf --cache --force_overwrite --vcf --fields
"Allele,Consequence,Feature_type,Feature"
```

VCFs produced by Ensembl VEP can be filtered using [filter_vep.pl](#) in the same way as standard format output files.

If the input format was VCF, the file will remain unchanged save for the addition of the CSQ field and the header (unless using any filtering). If an existing CSQ field is found, it will be replaced by the new annotation (use [--keep_csq](#) to preserve it).

Custom data added with [--custom](#) are added as separate fields, using the key specified for each data file.

Commas in fields are replaced with ampersands (&) to preserve VCF format.

```

##INFO=<ID=CSQ,Number=.,Type=String,Description="Consequence annotations from Ensembl VEP. Format:

JSON output

Ensembl VEP can output serialised JSON objects using the [--json](#) flag. JSON is a serialisation format that can be pars

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

processed easily by many packages and programming languages; it is used as the default output format for [Ensembl's f](#)

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Each input variant is reported as a single JSON object which constitutes one line of the output file. The JSON object is structured somewhat differently to the other output formats, in that per-variant fields (e.g. co-located existing variant details) are reported only once. Consequences are grouped under the feature type that they affect (Transcript, Regulatory Feature, etc). The original input line (e.g. from VCF input) is reported under the "input" key in order to aid aligning input with output. When using a cache file, frequencies for co-located variants are reported by default (see [--af 1kg](#), [--af gnomade](#)).

Here follows an example of JSON output (prettified and redacted for display here):

```
{
  "input": "1 1918090 test1 A G . . .",

In accordance with JSON conventions, all keys (except alleles) are lower-case. Some keys also have different names and structures to those found in the other Ensembl VEP output formats:

Key	JSON equivalent(s)	Notes
Consequence	consequence_terms	
Gene	gene_id	
Feature	transcript_id, regulatory_feature_id, motif_feature_id	Consequences are grouped under the feature type they affect
ALLELE	variant_allele	
SYMBOL	gene_symbol	
SYMBOL_SOURCE	gene_symbol_source	
ENSP	protein_id	
OverlapBP	bp_overlap	
OverlapPC	percentage_overlap	
Uploaded_variation	id	
Location	seq_region_name, start, end, strand	The variant's location field is broken down into constituent coordinate parts for clarity. "seq_region_name" is used in place of "chr" or "chromosome" for consistency with other parts of Ensembl's REST API
*_maf	*_allele, *_maf	
cDNA_position	cdna_start, cdna_end	
CDS_position	cds_start, cds_end	
Protein_position	protein_start, protein_end	
SIFT	sift_prediction, sift_score	
PolyPhen	polyphen_prediction, polyphen_score	

Statistics

Ensembl VEP writes an HTML file containing statistics pertaining to the results of your job; it is named **[output_file]_summary.html** (with the default options the file will be named **variant_effect_output.txt_summary.html**). To view it, please open the file in your web browser.

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

- To prevent Ensembl VEP writing a stats file, use `--no_stats`.

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- To get a machine-readable text file in place of the HTML file, use `--stats text`. You can get both a HTML file and plain text file by using both `--stats text` and `--stats html`.
- To change the name of the stats file from the default, use `--stats file [file]`.

The page contains several sections:

General statistics

This section contains two tables. The first describes the cache and/or database used, the version of Ensembl VEP, species, command line parameters, input/output files and run time. The second table contains information about the number of variants, and the number of genes, transcripts and regulatory features overlapped by the input.

Charts and tables

There then follows several charts, most with accompanying tables. Tables and charts are interactive; clicking on a row to highlight it in the table will highlight the relevant segment in the chart, and vice versa.

Ensembl VEP is run on the command line as follows (assuming you are in the ensembl-vep directory):

```
./vep [options]
```

where [options] represent a set of flags and options. A basic set of flags can be listed using [--help](#):

```
./vep --help
```

Ensembl VEP can be run in the following modes:

- For optimum performance, download a cache file for your species of interest, using either the  [installer](#) or by following the [VEP Cache documentation](#), and run Ensembl VEP with either the [--cache](#) or [--offline](#) option.
- By connecting to the public Ensembl database servers in place of a cache. This can be adequate when annotating small files, but the database servers can become busy and slow. To enable this option, use [--database](#).
- To run Ensembl VEP using your own species and assembly, please use a [--fasta](#) file and [--gff](#) or [--gtf](#) annotation.

To run Ensembl VEP with default options, use the following command:

```
./vep --cache -i input.txt -o output.txt
```

where `input.txt` contains data in one of the compatible [input formats](#) and `output.txt` is the [output file](#) to be created.

Options can be passed as the full string (e.g. [--format](#)), or as the shortest unique string among the options (e.g. [--form](#) for [--format](#), since there is another option [--force overwrite](#)).

You may use one or two hyphen ("-") characters before each option name; **--cache** or **-cache**.

Ensembl VEP options can also be read from:

- **Configuration files** using [--config](#). Options set in configuration files are overridden if specified on the command line.
- **Environment variables** that start with prefix `VEP_`. For instance, you can set the cache flag with `export VEP_CACHE=1` and the input flag with `export VEP_INPUT="/path/to/input.txt"` before running `./vep`. Options set in environment variables are overridden if specified in configuration files or on the command line.

Basic options

Flag	Alternate	Description	Incompatibl e with
--help		Display help message and quit	
--quiet	-q	Suppress warning messages. <i>Not used by default</i>	--verbose
--verbose	-v	Print out a bit more information while running. <i>Not used by default</i>	--quiet
--config [filename]		Load configuration options from a config file. The config file should consist of whitespace-separated pairs of option names and settings e.g.: <pre>output_file my_output.txt species mus_musculus format vcf host useastdb.ensembl.org</pre>	

		setting the flags as normal and running Ensembl VEP in verbose (-v) mode. This will output lines that can be copied to a config file that can be loaded in on the next run using --config . <i>Not used by default</i>
<code>--everything</code>	<code>-e</code>	Shortcut flag to switch on all of the following: --sift b , --polyphen b , --ccds , --hgvs , --symbol , --numbers , --domains , --regulatory , --canonical , --protein , --biotype , --af , --af 1kg , --af gnomadg , --af gnomadg , --max af , --pubmed , --uniprot , --mane , --tsl , --appris , --variant class , --gene phenotype , --mirna
<code>--species [species]</code>		Species for your data. This can be the latin name e.g. "homo_sapiens" or any Ensembl alias e.g. "mouse". Specifying the latin name can speed up initial database connection as the registry does not have to load all available database aliases on the server. <i>Default = "homo_sapiens"</i>
<code>--assembly [name]</code>	<code>-a</code>	Select the assembly version to use if more than one available. If using the cache, you must have the appropriate assembly's cache file installed. If not specified and you have only 1 assembly version installed, this will be chosen by default. <i>Default = use found assembly version</i>
<code>--input_file [filename]</code>	<code>-i</code>	Input file name. If not specified, Ensembl VEP will attempt to read from STDIN. Can use compressed file (gzipped).
<code>--input_data [string]</code>	<code>--id</code>	Raw input data as a string. May be used, for example, to input a single rsID or HGVS notation quickly to Ensembl VEP: <code>--input_data rs699</code>
<code>--format [format]</code>		Input file format - one of "ensembl", "vcf", "hgvs", "id", "region", "spdi". By default, Ensembl VEP auto-detects the input file format. Using this option you can specify the input file is Ensembl, VCF, IDs, HGVS, SPDI or region format. Can use compressed version (gzipped) of any file format listed above. <i>Auto-detects format by default</i>
<code>--output_file [filename]</code>	<code>-o</code>	Output file name. Results can write to STDOUT by specifying 'STDOUT' as the output file name - this will force quiet mode. <i>Default = "variant_effect_output.txt"</i>
<code>--force_overwrite</code>	<code>--force</code>	By default, Ensembl VEP will fail with an error if the output file already exists. You can force the overwrite of the existing file by using this flag. <i>Not used by default</i>
<code>--no_stats</code>		Don't generate a stats file. Provides marginal gains in run time.
<code>--stats_file [filename]</code>	<code>--sf</code>	Summary stats file name. This file contains a summary of the Ensembl VEP run. If stats are returned in an HTML file (default), the filename should end in .html or .htm. <i>Default = "variant_effect_output.txt_summary.html"</i>
<code>--stats_html</code>		Generate a HTML stats file (default).
<code>--stats_text</code>		Generate a plain text stats file. Can be combined with --stats_html to generate both plain text and HTML stats files.
<code>--warning_file [filename]</code>		File name to write warnings and errors to. <i>Default = STDERR (standard error)</i>
<code>--skipped_variants_file [filename]</code>		File name to write skipped variants to. <i>Default = STDERR (standard error)</i>
<code>--max_sv_size</code>		Limit the maximum Structural Variant size Ensembl VEP will process to reduce potential memory usage. Set to -1 to disable this filter. Warning: disabling this filter can result in a large memory usage and slow runtime. <i>Default = 10000000</i>
<code>--no_check_variants_or</code>		Permit the use of unsorted input files. However running Ensembl VEP on unsorted input files slows down the tool and requires more memory.
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use		

<code>--fork [num_forks]</code>	Enable forking , using the specified number of forks. Forking can dramatically improve runtime. <i>Not used by default</i>
<code>--safe</code>	By default, an Ensembl VEP run is successful even when a plugin reports issues. Use this flag to ensure Ensembl VEP fails if a plugin raises warnings or generates compilation errors. This is particularly useful to ensure plugins run successfully when using Ensembl VEP in pipelines. <i>Not used by default</i>

Cache options

Flag	Alternate	Description	Output fields	Incompatibl e with
<code>--cache</code>		Enables use of the cache . Add <code>--refseq</code> or <code>--merged</code> to use the refseq or merged cache, (if installed).		--database
<code>--dir [directory]</code>		Specify the base cache/plugin directory to use. <i>Default = "\$HOME/.vep/"</i>		
<code>--dir_cache [directory]</code>		Specify the cache directory to use. <i>Default = "\$HOME/.vep/"</i>		
<code>--dir_plugins [directory]</code>		Specify the plugin directory to use. <i>Default = "\$HOME/.vep/"</i>		
<code>--offline</code>		Enable offline mode . No database connections will be made, and a cache file or GFF/GTF file is required for annotation. Add <code>--refseq</code> to use the refseq cache (if installed). <i>Not used by default</i>		--database --check_svs --lrg
<code>--fasta [file dir]</code>	<code>--fa</code>	Specify a FASTA file or a directory containing FASTA files to use to look up reference sequence. The first time you run Ensembl VEP with this parameter an index will be built which can take a few minutes. This is required if fetching HGVS annotations (--hgvs) or checking reference sequences (--check_ref) in offline mode (<code>--offline</code>), and optional with some performance increase in cache mode (<code>--cache</code>). See documentation for more details. <i>Not used by default</i>		
<code>--refseq</code>		Specify this option if you have installed the RefSeq cache in order for Ensembl VEP to pick up the alternate cache directory. This cache contains transcript objects corresponding to RefSeq transcripts. Consequence output will be given relative to these transcripts in place of the default Ensembl transcripts (see documentation)	REFSEQ_MAT CH, BAM_EDIT	-- gencode_bas ic -- gencode_pri mary --merged
<code>--merged</code>		Use the merged Ensembl and RefSeq cache. Consequences are flagged with the SOURCE of each transcript used.	REFSEQ_MAT CH, BAM_EDIT, SOURCE	--refseq
<code>--cache_version</code>		Use a different cache version than the assumed default (the Ensembl VEP version). This should be used with Ensembl Genomes caches since their version numbers do not match Ensembl versions. For example, the VEP/Ensembl version may be 88 and the Ensembl Genomes version 35. <i>Not used by default</i>		
<code>--show_cache_info</code>		Show source version information for selected cache and quit		
<code>--buffer_size [number]</code>		Sets the internal buffer size, corresponding to the number of variants that are read in to memory simultaneously. Set this lower to use less memory at the expense of longer run time, and higher to use more memory with a faster run time. <i>Default = 5000</i>		

Other annotation sources

Flag	Alternate	Description	Output fields
<code>--plugin [plugin name]</code>		Use named plugin. Plugin modules should be installed in the Plugins subdirectory of the Ensembl VEP cache directory (defaults to \$HOME/.vep/). Multiple plugins can be used by supplying the <code>--plugin</code> flag multiple times. See plugin documentation . <i>Not used by default</i>	Plugin-dependent
<code>--custom file=[filename]</code>		Add custom annotation to the output. Files must be tabix indexed or in the bigWig format. Multiple files can be specified by supplying the <code>--custom</code> flag multiple times. See here for full details. <i>Not used by default</i>	SOURCE, Custom file dependent
<code>--gff [filename]</code>		Use GFF transcript annotations in [filename] as an annotation source. Requires a FASTA file of genomic sequence. <i>Not used by default</i>	SOURCE
<code>--gtf [filename]</code>		Use GTF transcript annotations in [filename] as an annotation source. Requires a FASTA file of genomic sequence. <i>Not used by default</i>	SOURCE
<code>--bam [filename]</code>		ADVANCED Use BAM file of sequence alignments to correct transcript models not derived from reference genome sequence. Used to correct RefSeq transcript models . Not required when using with the refseq or merged caches as they are already corrected, if used with those caches, errors may occur. Enables <code>--use_transcript_ref</code> ; add <code>--use_given_ref</code> to override this behaviour. <i>Not used by default</i>	BAM_EDIT
<code>--use_transcript_ref</code>		By default Ensembl VEP uses the reference allele provided in the input file to calculate consequences for the provided alternate allele(s). Use this flag to force Ensembl VEP to replace the provided reference allele with sequence derived from the overlapped transcript. This is especially relevant when using the RefSeq cache, see documentation for more details. The GIVEN_REF and USED_REF fields are set in the output to indicate any change. <i>Not used by default</i>	GIVEN_REF, USED_REF
<code>--use_given_ref</code>		Using <code>--bam</code> or a BAM-edited RefSeq cache by default enables <code>--use_transcript_ref</code> ; add this flag to override this behaviour and use the provided reference allele from the input. <i>Not used by default</i>	
<code>--custom_multi_allelic</code>		By default, comma separated lists found within the INFO field of custom annotation VCFs are assumed to be allele specific. For example, a variant with allele_string A/G/C with associated custom annotation 'single,double,triple' will associate triple with C, double with G and single with A. This flag instructs Ensembl VEP to return all annotations for all alleles. <i>Not used by default</i>	

Output format options

Flag	Alternate	Description	Output fields	Incompatible with
<code>--vcf</code>		Writes output in VCF format . Consequences are added in the INFO field of the VCF file, using the key "CSQ". Data fields are encoded separated by " "; the order of fields is written in the VCF header. Output fields in the "CSQ" INFO field can be selected by using <code>--fields</code> . If the input format was VCF, the file will remain unchanged save for the addition of the CSQ field (unless using any filtering). Custom data added with <code>--custom</code> are added as separate fields, using the key specified for each data file.		--json --tab --summary <code>--</code> most_severe --ga4gh_vrs

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#).

	<i>Not used by default</i>			
--tab		Writes output in tab-delimited format . <i>Not used by default</i>		--json --vcf
--json		Writes output in JSON format . <i>Not used by default</i>		--tab --vcf
--compress_output [gzip bgzip]		Writes output compressed using either gzip or bgzip. <i>Not used by default</i>		
--fields [list]		Configure the output format using a comma separated list of fields. Can only be used with tab (--tab) or VCF format (--vcf) output. For the tab format output, the selected fields may be those present in the default output columns, or any of those that appear in the Extra column (including those added by plugins or custom annotations) if the appropriate output is available (e.g. use --show_ref_allele to access 'REF_ALLELE'). Output remains tab-delimited. For the VCF format output, the selected fields are those present within the "CSQ" INFO field. Example of command for the tab output: <pre>--tab --fields "Uploaded_variation,Location,Allele,Gene"</pre> Example of command for the VCF format output: <pre>--vcf --fields "Allele,Consequence,Feature_type,Feature"</pre>		
	<i>Not used by default</i>			
--minimal		Convert alleles to their most minimal representation before consequence calculation i.e. sequence that is identical between each pair of reference and alternate alleles is trimmed off from both ends, with coordinates adjusted accordingly. Note this may lead to discrepancies between input coordinates and coordinates reported by Ensembl VEP relative to transcript sequences; to avoid issues, use --allele_number and/or ensure that your input variants have unique identifiers. The MINIMISED flag is set in the Ensembl VEP output where relevant. For an insertion/deletion, the allele is minimised by default. To access the input allele before minimisation, use --uploaded_allele. <i>Not used by default</i>	MINIMISED	--individual

Output options

Flag	Alternate	Description	Output fields	Incompatibl e with
--variant_class		Output the Sequence Ontology variant class . <i>Not used by default</i>	VARIANT_C LASS	
--sift [p s b]		Species limited SIFT  predicts whether an amino acid substitution affects protein function based on sequence homology and the physical properties of amino acids. Ensembl VEP can output the prediction term, score or both. <i>Not used by default</i>	SIFT	--most_severe_summary

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

<code>--polyphen [p s b]</code>	Human only PolyPhen is a tool which predicts possible impact of an amino acid substitution on the structure and function of a human protein using straightforward physical and comparative considerations. Ensembl VEP can output the prediction term, score or both . Ensembl VEP uses the humVar score by default - use <code>--humdiv</code> to retrieve the humDiv score. <i>Not used by default</i>	PolyPhen	<code>--most_severe</code> <code>--summary</code>
<code>--humdiv</code>	Human only Retrieve the humDiv PolyPhen prediction instead of the default humVar. <i>Not used by default</i>	PolyPhen	
<code>--nearest [transcript gene symbol]</code>	Retrieve the transcript or gene with the nearest protein-coding transcription start site (TSS) to each input variant. Use "transcript" to retrieve the transcript stable ID, "gene" to retrieve the gene stable ID, or "symbol" to retrieve the gene symbol. Note that the nearest TSS may not belong to a transcript that overlaps the input variant, and more than one may be reported in the case where two are equidistant from the input coordinates. Currently only available when using a cache annotation source, and requires the Set::IntervalTree perl module . <i>Not used by default</i>	NEAREST	
<code>--distance [bp_distance(, downstream_distance)]</code>	Modify the distance up and/or downstream between a variant and a transcript for which Ensembl VEP will assign the upstream_gene_variant or downstream_gene_variant consequences. Giving one distance will modify both up- and downstream distances; providing two separated by commas will set the up- (5') and down- (3') stream distances respectively. <i>Default: 5000</i>		
<code>--overlaps</code>	Report the proportion and length of a transcript overlapped by a structural variant in VCF format.		
<code>--gene_phenotype</code>	Indicates if the overlapped gene is associated with a phenotype, disease or trait. See list of phenotype sources . <i>Not used by default</i>	GENE_PHE NO	
<code>--regulatory</code>	Look for overlaps with regulatory regions. Ensembl VEP can also report if a variant falls in a high information position within a transcription factor binding site. Output lines have a Feature type of RegulatoryFeature or MotifFeature. <i>Not used by default</i>	MOTIF_NAME, MOTIF_POS, HIGH_INF_POS, MOTIF_SCORE_CHANGE	
<code>--cell_type</code>	Report only regulatory regions that are found in the given cell type(s). Can be a single cell type or a comma-separated list. The functional type in each cell type is reported under CELL_TYPE in the output. To retrieve a list of cell types, use <code>--cell_type list</code> . <i>Not used by default</i>	CELL_TYPE	
<code>--individual [all ind list]</code>	Consider only alternate alleles present in the genotypes of the specified individual(s). May be a single individual, a comma-separated list or "all" to assess all individuals separately. Individual variant combinations homozygous for the given reference allele will not be reported. Each individual and variant combination is given on a separate line of output. Only works with VCF files containing individual genotype data; individual IDs are taken from column headers. <i>Not used by default</i>	IND, ZYG	<code>--minimal</code> <code>--individual_zyg</code>
<code>--individual_zyg [all ind list]</code>	Consider alternate and reference alleles present in the genotypes of the specified individual(s). May be a single individual, a comma-separated list or "all" to assess all individuals separately. Returns a list of individuals and their zygosity. Only works with VCF files containing individual genotype data; individual IDs are taken from column headers. <i>Not used by default</i>	ZYG	<code>--individual</code>
<code>--phased</code>	Force VCF genotypes to be interpreted as phased. For use with you are agreeing to this as outlined in our Privacy Policy and Terms of Use		

<code>--allele_number</code>		Identify allele number from VCF input, where 1 = first ALT allele, 2 = second ALT allele etc. Useful when using --minimal . <i>Not used by default</i>	ALLELE_NUMBER	
<code>--show_ref_allele</code>		Adds the reference allele in the output (after minimisation). Mainly useful for the Ensembl VEP "default" and tab-delimited output formats. <i>Not used by default</i>	REF_ALLELE	
<code>--uploaded_allele</code>		Adds the uploaded allele string in the output (before minimisation).	UPLOADED_ALLELE	
<code>--total_length</code>		Give cDNA, CDS and protein positions as Position/Length. <i>Not used by default</i>		
<code>--numbers</code>		Adds affected exon and intron numbering to output. Format is Number/Total. <i>Not used by default</i>	EXON, INTRON	--most_severe --summary
<code>--mirna</code>		Reports where the variant lies in the miRNA secondary structure (only for Ensembl/GENCODE transcripts). <i>Not used by default</i>		
<code>--no_escape</code>		Don't URI escape HGVS field. <i>Default = escape</i>		
<code>--keep_csq</code>		Don't overwrite existing CSQ entry in VCF INFO field . A new consequence will be added, not merged with the original. <i>Overwrites by default</i>		
<code>--vcf_info_field</code> [CSQ ANN (other)]		Change the name of the INFO key that Ensembl VEP write the consequences to in its VCF output . Use "ANN" for compatibility with other tools such as snpEff . <i>Default: CSQ</i>		
<code>--terms</code> [SO display NCBI]	<code>-t</code>	The type of consequence terms to output. The Ensembl terms are described here . The Sequence Ontology is a joint effort by genome annotation centres to standardise descriptions of biological sequences. <i>Default = "SO"</i>		
<code>--no_headers</code>		Don't write header lines in output files. <i>Default = add headers</i>		
<code>--shift_3prime</code> [0 1]		Right aligns all variants relative to their associated transcripts prior to consequence calculation. An example using this option can be found here . <i>Default = 0</i>		--shift_hgvs
<code>--shift_genomic</code> [0 1]		Right aligns all variants, including intergenic variants, before consequence calculation and updates the <i>Location</i> field. An example using this option can be found here . <i>Default = 0</i>		--shift_hgvs
<code>--shift_length</code>		Reports the distance each variant has been shifted when used in conjunction with --shift_3prime		

Identifiers

Flag	Alternate	Description	Output fields	Incompatibl e with
<code>--hgvs</code>		Add HGVS nomenclature based on Ensembl stable identifiers to the output. Both coding and protein sequence names are added where appropriate. To generate HGVS identifiers when using --cache or --offline you must use a FASTA file and --fasta . HGVS notations given on Ensembl identifiers are versioned . <i>Not used by default</i>	HGVSc, HGVSg, HGVS_OFF SET	
<code>--hgvs_g</code>		Add genomic HGVS nomenclature based on the input chromosome name. To generate HGVS identifiers when using --cache or --offline you must use a FASTA file and --fasta . <i>Not used by default</i>	HGVScg	

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

-- hgvs_g_use_accession	Force --hgvs_g to return RefSeq reference sequence. For example, reports NC_000002.11 for human chromosome 2 (build GRCh38).	HGVSg	
-- hgvsp_use_prediction	Force --hgvs to return the HGVS notation in predicted format. For example, ENSP00000233741.4:p.Thr367AsnfsTer13 will be returned as ENSP00000233741.4:p.(Thr367AsnfsTer13).	HGVS	
--ambiguous_hgvs [0 1]	Allow input HGVS to resolve to all genomic locations. Otherwise, most likely transcript will be selected. <i>Default: 0 (most likely transcript selected)</i>		
--spdi	Add genomic SPDI notation. To generate SPDI when using --cache or --offline you must use a FASTA file and --fasta . <i>Not used by default</i>	SPDI	
--ga4gh_vrs	Add GA4GH Variation Representation Specification (VRS) notation. To generate GA4GH VRS when using --cache or --offline you must use a FASTA file and --fasta . <i>Not used by default</i>	GA4GH_VRS	--vcf
--shift_hgvs [0 1]	Enable or disable 3' shifting of HGVS notations. HGVS nomenclature requires an ambiguous sequence change to be described at the most 3' possible location. When enabled, this causes "shifting" to the most 3' possible coordinates (relative to the transcript sequence and strand) before the HGVS notations are calculated; the flag HGVS_OFFSET is set to the number of bases by which the variant has shifted, relative to the input genomic coordinates. If HGVS_OFFSET is equals to 0, no value will be added to HGVS_OFFSET column. To disable the changing of location at transcript level set --shift_hgvs to 0. <i>Default: 1 (shift)</i>		--shift_3prime --shift_genomic
--transcript_version	Add version numbers to Ensembl transcript identifiers		
--gene_version	Add version numbers to Ensembl gene identifiers		
--protein	Add the Ensembl protein identifier to the output where appropriate. <i>Not used by default</i>	ENSP	--most_severe --summary
--symbol	Adds the gene symbol (e.g. HGNC) (where available) to the output. Some gene symbol, e.g. HGNC, are only available in merged and Ensembl caches and therefore should not be used with the --refseq cache option. <i>Not used by default</i>	SYMBOL, SYMBOL_SOURCE, HGNC_ID	--most_severe --summary
--ccds	Adds the CCDS transcript identifier (where available) to the output. <i>Not used by default</i>	CCDS	--most_severe --summary
--uniprot	Adds best match accessions for translated protein products from three UniProt -related databases (SWISSPROT, TREMBL and UniParc) to the output. <i>Not used by default</i>	SWISSPROT, TREMBL, UNIPARC, UNIPROT_ISOFORM	--most_severe --summary
--tsl	Adds the transcript support level for this transcript to the output. <i>Not used by default</i>	TSL	--most_severe --summary
--appris	Adds the APPRIS isoform annotation for this transcript to the output. <i>Not used by default</i>	APPRIS	--most_severe --summary
--canonical	Adds a flag indicating if the transcript is the canonical transcript for the gene. <i>Not used by default</i>	CANONICAL	--most_severe --summary
--mane	Adds a flag indicating if the transcript is the MANE Select or MANE Plus Clinical transcript for the gene. If --cache or --database annotation source is used, the alternative transcript stable ID is also added. <i>Not used by default</i>	MANE, MANE_SELECT, MANE_PLUS_CLINICAL	--

<code>--mane_select</code>	Adds a flag indicating if the transcript is the MANE Select transcript for the gene. If <code>--cache</code> or <code>--database</code> annotation source is used, the alternative transcript stable ID is also added. <i>Not used by default</i>	MANE, MANE_SELECT	--most_severe --summary
<code>--biotype</code>	Adds the biotype of the transcript or regulatory feature. <i>Not used by default</i>	BIOTYPE	--most_severe --summary
<code>--domains</code>	Adds names of overlapping protein domains to output. <i>Not used by default</i>	DOMAINS	--most_severe --summary
<code>--xref_refseq</code>	Output aligned RefSeq mRNA identifier for transcript. <i>Not used by default</i>	RefSeq	--most_severe --summary
<code>--synonyms [file]</code>	Load a file of chromosome synonyms. File should be tab-delimited with the primary identifier in column 1 and the synonym in column 2. Synonyms allow different chromosome identifiers to be used in the input file and any annotation source (cache, database, GFF, custom file, FASTA file). <i>Not used by default</i>		

Co-located variants

Flag	Alternate	Description	Output fields	Incompatibl e with
<code>--check_existing</code>		Checks for the existence of known variants that are co-located with your input. By default the alleles are compared and variants on an allele-specific basis - to compare only coordinates, use --no_check_alleles . Some databases may contain variants with unknown (null) alleles and these are included by default; to exclude them use --exclude_null_alleles . See this page for more details. <i>Not used by default</i>	Existing_variation, CLIN_SIG, SOMATIC, PHENO	
<code>--check_sv</code>		Checks for the existence of structural variants that overlap your input. Currently requires database access. <i>Not used by default</i>	SV	--offline
<code>--clin_sig_allele [1 0]</code>		Return allele specific clinical significance. Setting this option to 0 will provide all known clinical significance values at the given locus. <i>Default: 1 (Provide allele-specific annotations)</i>	CLIN_SIG	
<code>--clinvar_somatic_classification</code>		Return the somatic classification of a variant as reported by ClinVar. <i>Not used by default</i>	SOMATIC_CLASSIFICATION	
<code>--exclude_null_alleles</code>		Do not include variants with unknown alleles when checking for co-located variants. Our human database contains variants from HGMD and COSMIC for which the alleles are not publically available; by default these are included when using --check_existing , use this flag to exclude them. <i>Not used by default</i>		
<code>--no_check_alleles</code>		When checking for existing variants, by default Ensembl VEP only reports a co-located variant if none of the input alleles are novel. For example, if your input variant has alleles A/G, and an existing co-located variant has alleles A/C, the co-located variant will not be reported.		

This website requires cookies, and the limited processing of your personal data in order to function. By using the site Strand is also taken into account - in the same example, if the you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#) then

the co-located variant **will** be reported since its alleles match the reverse complement of input variant.

Use this flag to disable this behaviour and compare using coordinates alone. *Not used by default*

--af		Add the global allele frequency (AF) from 1000 Genomes Phase 3 data for any known co-located variant to the output. For this and all --af_* flags, the frequency reported is for the input allele only, not necessarily the non-reference or derived allele. <i>Not used by default</i>	AF	
--max_af		Report the highest allele frequency observed in any population from 1000 genomes, ESP or gnomAD. <i>Not used by default</i>	MAX_AF, MAX_AF_PO PS	--database
--af_1kg		Add allele frequency from continental populations (AFR,AMR,EAS,EUR,SAS) of 1000 Genomes Phase 3 to the output. Must be used with --cache . <i>Not used by default</i>	AFR_AF, AMR_AF, EAS_AF, EUR_AF, SAS_AF	--database
--af_esp		Include allele frequency from NHLBI-ESP populations. Must be used with --cache . <i>Please note this option is deprecated and will produce an error from Ensembl VEP version 107 onwards.</i>	AA_AF, EA_AF	--database
--af_gnomade	--af_gnomad	Include allele frequency from Genome Aggregation Database (gnomAD) exome populations. Note only data from the gnomAD exomes are included; to retrieve data from the additional genomes data set, see this guide . Must be used with --cache <i>Not used by default</i>	gnomADe_A F, gnomADe_A FR_AF, gnomADe_A MR_AF, gnomADe_A SJ_AF, gnomADe_E AS_AF, gnomADe_FI N_AF, gnomADe_N FE_AF, gnomADe_O TH_AF, gnomADe_S AS_AF	--database --af_gnomad
--af_gnomadg		Include allele frequency from Genome Aggregation Database (gnomAD) genome populations. Note only data from the gnomAD genomes are included; to retrieve data from the additional genomes data set, see this guide . Must be used with --cache <i>Not used by default</i>	gnomADg_A F, gnomADg_A FR_AF, gnomADg_A MI_AF, gnomADg_A MR_AF, gnomADg_A SJ_AF, gnomADg_E AS_AF, gnomADg_FI N_AF, gnomADg_M ID_AF, gnomADg_N FE_AF, gnomADg_O TH_AF, gnomADg_S AS_AF	--database
--af_exac		Include allele frequency from ExAC project populations. Must be used with --cache . <i>Deprecated.</i>	ExAC_AF, ExAC_Adj_A F, ExAC_AFR_ AF, ExAC_AMR_	--database

		AF, ExAC_EAS_ AF, ExAC_FIN_A F, ExAC_NFE_ AF, ExAC_OTH_ AF, ExAC_SAS_ AF	
--pubmed	Report Pubmed IDs for publications that cite existing variant. Must be used with --cache . <i>Not used by default</i>	PUBMED	--database
--var_synonyms	Report known synonyms for co-located variants. Must be used with --cache . <i>Not used by default</i>	VAR_SYNO NYMS	--database
--failed [0 1]	When checking for co-located variants, by default Ensembl VEP will exclude variants that have been flagged as failed. Set this flag to include such variants. <i>Default: 0 (exclude)</i>		

Filtering and QC options

NOTE: The filtering options here filter your results **before** they are written to your output file. Using Ensembl VEP's [filtering script](#), it is possible to filter your results **after** Ensembl VEP has run. This way you can retain all of the results and run multiple filter sets on the same results to find different data of interest.

Flag	Alternate	Description	Output fields	Incompatibl e with
--gencode_basic		Limit your analysis to transcripts belonging to the GENCODE basic set. This set has fragmented or problematic transcripts removed. <i>Not used by default</i>		-- gencode_pri mary --refseq
--gencode_primary		Limit your analysis to transcripts belonging to the GENCODE primary set. This set covers all human exons in a minimal set of transcripts. <i>Not used by default</i>		-- gencode_bas ic --refseq
--exclude_predicted		When using the RefSeq or merged cache, exclude predicted transcripts (i.e. those with identifiers beginning with "XM_" or "XR_").		
--transcript_filter		ADVANCED Filter transcripts according to any arbitrary set of rules. Uses similar notation to filter_vep. You may filter on any key defined in the root of the transcript object; most commonly this will be "stable_id": <pre>--transcript_filter "stable_id match N[MR]_"</pre> or, a list of stable ids in file acting as a allowlist or a blocklist: <pre>--transcript_filter "not stable_id in blocklist.txt"</pre>		
--check_ref		Force Ensembl VEP to check the supplied reference allele against the sequence stored in the Ensembl Core database or supplied FASTA file . Lines that do not match are skipped. Checking is done on the minimised sequence. Example chr13 32900399 . AGT A . the As are removed and the reference sequence is checked from 32900400 to see if it matches GTNot used by default		--lookup_ref

<code>--lookup_ref</code>	Force overwrite the supplied reference allele with the sequence stored in the Ensembl Core database or supplied FASTA file . <i>Not used by default</i>		--check_ref
<code>--dont_skip</code>	Don't skip input variants that fail validation, e.g. those that fall on unrecognised sequences. Combining --check_ref with --dont_skip will add a CHECK_REF output field when the given reference does not match the underlying reference sequence.	CHECK_REF	
<code>--allow_non_variant</code>	When using VCF format as input and output, by default Ensembl VEP will skip non-variant lines of input (where the ALT allele is null). Enabling this option the lines will be printed in the VCF output with no consequence data added.		
<code>--chr [list]</code>	Select a subset of chromosomes to analyse from your file. Any data not on this chromosome in the input will be skipped. The list can be comma separated, with "-" characters representing an interval. For example, to include chromosomes 1, 2, 3, 10 and X you could use --chr 1-3,10,X <i>Not used by default</i>		
<code>--coding_only</code>	Only return consequences that fall in the coding regions of transcripts. <i>Not used by default</i>		--most_severe --summary
<code>--no_intergenic</code>	Do not include intergenic consequences in the output. <i>Not used by default</i>		--most_severe --summary
<code>--pick</code>	Pick one line or block of consequence data per variant, including transcript-specific columns. Consequences are chosen according to the criteria described here , and the order the criteria are applied may be customised with --pick_order . This is the best method to use if you are interested only in one consequence per variant. <i>Not used by default</i>		--most_severe --summary
<code>--pick_allele</code>	Like --pick , but chooses one line or block of consequence data per variant allele. Will only differ in behaviour from --pick when the input variant has multiple alternate alleles. <i>Not used by default</i>		--most_severe --summary
<code>--per_gene</code>	Output only the most severe consequence per gene. The transcript selected is arbitrary if more than one has the same predicted consequence. Uses the same ranking system as --pick therefore, the highest ranking transcript is selected before the most severe consequence. <i>Not used by default</i>		
<code>--pick_allele_gene</code>	Like --pick_allele , but chooses one line or block of consequence data per variant allele and gene combination. <i>Not used by default</i>		
<code>--flag_pick</code>	As per --pick , but adds the PICK flag to the chosen block of consequence data and retains others. <i>Not used by default</i>	PICK	--most_severe --summary
<code>--flag_pick_allele</code>	As per --pick_allele , but adds the PICK flag to the chosen block of consequence data and retains others. <i>Not used by default</i>	PICK	--most_severe --summary
<code>--flag_pick_allele_gene</code>	As per --pick_allele_gene , but adds the PICK flag to the chosen block of consequence data and retains others. <i>Not used by default</i>	PICK	
<code>--pick_order [c1,c2,...,cN]</code>	Customise the order of criteria (and the list of criteria) applied when choosing a block of annotation data with one of the following options: --pick , --pick_allele , --per_gene , --pick_allele_gene , --flag_pick , --flag_pick_allele , --flag_pick_allele_gene . See this page for the default order.		

```
--pick --pick_order tsl,appris,rank
```

--most_severe

Output only the most severe consequence per variant.
Transcript-specific columns will be left blank. Consequence
ranks are given in [this table](#).
To include regulatory consequences, use the **--regulatory**
option in combination with this flag.
Not used by default

[--appris](#)
[--biotype](#)
[--canonical](#)
[--ccds](#)
[--coding_only](#)
[--domains](#)
[--flag_pick](#)

[--flag_pick_all](#)
[--flag_pick_ele](#)

[--no_intergenic](#)

--flag_gencode_primary
flag_gencode_primary

Flags transcripts as GENCODE primary using a boolean value.
Not used by default

GENCODE_
PRIMARY

--filter_common

Shortcut flag for the filters below - this will exclude variants that have a co-located existing variant with global AF > 0.01 (1%). May be modified using any of the following freq_* filters. *Not used by default*

FREQS

--check_frequency

Turns on frequency filtering. Use this to include or exclude variants based on the frequency of co-located existing variants in the Ensembl Variation database. You must also specify all of the --freq_* flags below. Frequencies used in filtering are added to the output under the FREQS key in the Extra field. *Not used by default*

FREQS

--freq_pop [pop]

Name of the population to use in frequency filter. This must be one of the following:

Name	Description
1KG_ALL	1000 genomes combined population (global)
1KG_AFR	1000 genomes combined African population
1KG_AMR	1000 genomes combined American population
1KG_EAS	1000 genomes combined East Asian population
1KG_EUR	1000 genomes combined European population
1KG_SAS	1000 genomes combined South Asian population
gnomAD	gnomAD exomes combined population

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

	Name	Description
	gnomADe_AFR	gnomAD exomes African/African American population
	gnomADe_AMR	gnomAD exomes Latino population
	gnomADe_ASJ	gnomAD exomes Ashkenazi Jewish population
	gnomADe_EAS	gnomAD exomes East Asian population
	gnomADe_FIN	gnomAD exomes Finnish population
	gnomADe_NFE	gnomAD exomes non-Finnish European population
	gnomADe_OTH	gnomAD exomes other population
	gnomADe_SAS	gnomAD exomes South Asian population
	gnomADg	gnomAD genomes combined population
	gnomADg_AFR	gnomAD genomes African/African American population
	gnomADg_AMR	gnomAD genomes Latino population
	gnomADg_AMI	gnomAD genomes Amish population
	gnomADg_ASJ	gnomAD genomes Ashkenazi Jewish population
	gnomADg_EAS	gnomAD genomes East Asian population
	gnomADg_FIN	gnomAD genomes Finnish population
	gnomADg_MID	gnomAD genomes Mid-eastern population
	gnomADg_NFE	gnomAD genomes non-Finnish European population
	gnomADg_OTH	gnomAD genomes other population
	gnomADg_SAS	gnomAD genomes South Asian population
--freq_freq [freq]	Allele frequency to use for filtering. Must be a float value between 0 and 1	
--freq_gt_lt [gt lt]	Specify whether the frequency of the co-located variant must be greater than (gt) or less than (lt) the value specified with --freq_freq	
--freq_filter [exclude include]	Specify whether to exclude or include only variants that pass the frequency filter	

Database options

Flag	Alternate	Description	Output fields	Incompatible with
--database		Enable Ensembl VEP to use local or remote databases.		--af_1kg --af_exac --af_gnomad --af_gnomade --af_gnomadg --cache --max_af --offline

<code>--host [hostname]</code>		Manually define the database host to connect to. Users in the US may find connection and transfer speeds quicker using our East coast mirror, <code>useastdb.ensembl.org</code> . <i>Default = "ensembl.db.ensembl.org"</i>
<code>--user [username]</code>	<code>-u</code>	Manually define the database username. <i>Default = "anonymous"</i>
<code>--password [password]</code>	<code>--pass</code>	Manually define the database password. <i>Not used by default</i>
<code>--port [number]</code>		Manually define the database port. <i>Default = 5306</i>
<code>--genomes</code>		Override the default connection settings with those for the Ensembl Genomes public MySQL server. Required when using any of the Ensembl Genomes species. <i>Not used by default</i>
<code>--is_multispecies [0 1]</code>		Some of the Ensembl Genomes databases (mainly bacteria and protists) are composed of a collection of close species. It updates the database connection settings (i.e. the database name) if the value is set to 1. <i>Default: 0</i>
<code>--lrg</code>		Map input variants to LRG coordinates (or to chromosome coordinates if given in LRG coordinates), and provide consequences on both LRG and chromosomal transcripts. <i>Not used by default</i> --offline
<code>--db_version [number]</code>		Force Ensembl VEP to connect to a specific version of the Ensembl databases. Not recommended as there may be conflicts between software and database versions. <i>Not used by default</i>
<code>--registry [filename]</code>		Defining a registry file overwrites other connection settings and uses those found in the specified registry file to connect. <i>Not used by default</i>

Ensembl VEP can use a variety of annotation sources to retrieve the transcript models used to predict consequence types.

- [Cache](#) - a downloadable file containing all transcript models, regulatory features and variant data for a species
- [GFF or GTF](#) - use transcript models defined in a tabix-indexed GFF or GTF file
 - Requires a [FASTA](#) file in [--offline](#) mode or if the desired species or assembly is not part of the [Ensembl species list](#).
- [Database](#) - connect to a MySQL database server hosting Ensembl databases

Data from VCF, BED and bigWig files can also be incorporated by Ensembl VEP's  [Custom annotation](#) feature.

Using a cache is the most efficient way to use Ensembl VEP; we would encourage you to use a cache wherever possible. Caches are easy to download and set up using the [installer](#). Follow the [tutorial](#) for a simple guide.

Caches

Using a cache ([--cache](#)) is the fastest and most efficient way to use Ensembl VEP, as in most cases only a single initial network connection is made and most data is read from local disk. Use [offline](#) mode to eliminate all network connections for speed and/or privacy.

Downloading caches

Cache files are created for every species for each Ensembl release. They can be automatically downloaded and configured using [INSTALL.pl](#).

If interested in RefSeq transcripts you may download an alternate cache file (e.g. `homo_sapiens_refseq`), or a merged file of RefSeq and Ensembl transcripts (eg `homo_sapiens_merged`); remember to specify [--refseq](#) or [--merged](#) when running Ensembl VEP to use the relevant cache. See [documentation](#) for full details.

Manually downloading caches

It is also simple to download and set up caches without using the installer. By default, Ensembl VEP searches for caches in `$HOME/.vep`; to use a different directory when running Ensembl VEP, use [--dir cache](#).

Indexed cache (https://ftp.ensembl.org/pub/release-116/variation/indexed_vep_cache/)

Essential for human and other species with large sets of variant data - requires [Bio::DB::HTS](#)  (setup by `INSTALL.pl`) or [tabix](#) , e.g.:

```
cd $HOME/.vep
curl -O https://ftp.ensembl.org/pub/release-116/variation/indexed_vep_cache/homo_sapiens_vep_116_GRCh38.tar.gz
tar xzf homo_sapiens_vep_116_GRCh38.tar.gz
```

FTP directories with indexed cache data:

Ensembl:	Vertebrates
Ensembl Genomes:	Bacteria Fungi Metazoa Plants Protists

NB: When using Ensembl Genomes caches, you should use the [--cache version](#) option to specify the relevant Ensembl Genomes version number as these differ from the concurrent Ensembl VEP version numbers.

HPRC and alternative assemblies

Ensembl VEP caches are also available for Human Pangenome Reference Consortium (HPRC) data at the [Ensembl HPRC data page](#) . Click [here](#) for more information on how to annotate variants on HPRC assemblies.

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

Data in the cache you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

The data content of Ensembl VEP caches vary by species. This table shows the contents of the default human cache files in release 116.

Source	Version (GRCh38)	Version (GRCh37)
Ensembl database version	116	116
Genome assembly	GRCh38.p14	GRCh37.p13
MANE Version	v1.5	n/a
GENCODE	50	19
RefSeq	GCF_000001405.40-RS_2025_08 (GCF_000001405.40_GRCh38.p14_genomic.gff)	GCF_000001405.25-RS_2024_09 (GCF_000001405.25_GRCh37.p13_genomic.gff)
Regulatory build	1.0	1.0
PolyPhen-2	2.2.3	2.2.2
SIFT	6.2.1	5.2.2
dbSNP	156	156
COSMIC	102	98
HGMD-PUBLIC	2020.4	2020.4
ClinVar	2025-09	2023-06
1000 Genomes	Phase 3 (remapped)	Phase 3
gnomAD exomes	v4.1	v4.1
gnomAD genomes	v4.1	v4.1

Data privacy and offline mode

When using the public database servers, Ensembl VEP requests transcript and variation data that overlap the loci in your input file. As such, these coordinates are transmitted over the network to a public server, which may not be appropriate for the analysis of sensitive or private data.

To use offline mode that does not use any network connections, use the flag `--offline`.

The [limitations](#) described above apply absolutely when using offline mode. For example, if you specify `--offline` and `--format id`, Ensembl VEP will report an error and refuse to run:

```
ERROR: Cannot use ID format in offline mode
```

All other features, including the ability to use [custom annotations](#) and [plugins](#), are accessible in offline mode.

GFF/GTF files

Ensembl VEP can use transcript annotations defined in [GFF](#) or [GTF](#) files. The files must be bgzipped and indexed with tabix and a [FASTA](#) file containing the genomic sequence is required in order to generate transcript models. This allows you to annotate variants from any species and assembly with these data.

Your GFF or GTF file must be sorted in chromosomal order. Ensembl VEP does not use header lines so it is safe to remove them.

```
grep -v "#" data.gff | sort -k1,1 -k4,4n -k5,5n -t$'\t' | bgzip -c > data.gff.gz
tabix -p gff data.gff.gz
./vep -i input.vcf --gff data.gff.gz --fasta genome.fa.gz
```

You may use any number of GFF/GTF files in this way, providing they refer to the same genome. You may also use them in concert with annotations from a cache or database source; annotations are distinguished by the SOURCE field in the output.

● GFF file

Example of command line with GFF, using flag `--gff` :

NOTE: If you wish to customise the name of the GFF as it appears in the SOURCE field and Ensembl VEP output header, use the [longer --custom annotation form](#):

```
--custom file=data.gff.gz,short_name=frequency,format=gff
```

● GTF file

Example of command line with GTF, using flag `--gtf` :

```
./vep -i input.vcf --cache --gtf data.gtf.gz --fasta genome.fa.gz
```

NOTE: If you wish to customise the name of the GFF as it appears in the SOURCE field and Ensembl VEP output header, use the [longer --custom annotation form](#):

```
--custom file=data.gtf.gz,short_name=frequency,format=gtf
```

GFF format expectations

Ensembl VEP has been tested on GFF files generated by Ensembl and NCBI (RefSeq). Due to inconsistency in the GFF specification and adherence to it, not all GFF files will be compatible with Ensembl VEP and not all transcript biotypes may be supported. Additionally, Ensembl VEP does not support GFF files with embedded FASTA sequence.

Column "type" (3rd column):

The following entity/feature types are supported by Ensembl VEP.

- | | |
|---------------------------------|--------------------------|
| ● aberrant_processed_transcript | ● processed_pseudogene |
| ● CDS | ● processed_transcript |
| ● C_gene_segment | ● pseudogene |
| ● D_gene_segment | ● pseudogenic_transcript |
| ● exon | ● RNA |
| ● gene | ● rRNA |
| ● J_gene_segment | ● rRNA_gene |
| ● lincRNA | ● snoRNA |
| ● lincRNA_gene | ● snoRNA_gene |
| ● miRNA | ● snRNA |
| ● miRNA_gene | ● snRNA_gene |
| ● mRNA | ● supercontig |
| ● mt_gene | ● transcript |
| ● ncRNA | ● tRNA |
| ● NMD_transcript_variant | ● VD_gene_segment |
| ● primary_transcript | ● V_gene_segment |

Lines of other types will be ignored; if this leads to an incomplete transcript model, the whole transcript model may be discarded. If unsupported types are used you will see a warning like the following -

```
WARNING: Ignoring 'five_prime utr' feature_type from Homo_sapiens.GRCh38.111.gtf.gz GFF/GTF file.  
This feature_type is not supported in Ensembl VEP.
```

Expected parameters in the 9th column:

● ID

Only required for the genes and transcripts entities.

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

● parent/Parent

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- Entities in the GFF are expected to be linked using a key named "**parent**" or "**Parent**" in the attributes (9th) column of the GFF.
- Unlinked entities (i.e. those with no parents **or** children) are discarded.
- Sibling entities (those that share the same parent) may have overlapping coordinates, e.g. for exon and CDS entities.

● **biotype**

Transcripts require a Sequence Ontology biotype to be defined in order to be used.

The simplest way to define this is using an attribute named "**biotype**" on the transcript entity. Other configurations are supported in order for Ensembl VEP to use GFF files from NCBI and other sources.

Here is an example:

```
##gff-version 3.2.1
##sequence-region 1 1 10000
1 Ensembl gene      1000  5000  . + . ID=genel;Name=GENE1
1 Ensembl transcript 1100  4900  . + . ID=transcript1;Name=GENE1-
001;Parent=genel;biotype=protein_coding
1 Ensembl exon      1200  1300  . + . ID=exon1;Name=GENE1-001_1;Parent=transcript1
1 Ensembl exon      1500  3000  . + . ID=exon2;Name=GENE1-001_2;Parent=transcript1
1 Ensembl exon      3500  4000  . + . ID=exon3;Name=GENE1-001_2;Parent=transcript1
1 Ensembl CDS       1300  3800  . + . ID=cds1;Name=CDS0001;Parent=transcript1
```

GTF format expectations

The following GTF entity types will be extracted:

- cds (or CDS)
- stop_codon
- exon
- gene
- transcript

Entities are linked by an attribute named for the **parent** entity type e.g. exon is linked to transcript by transcript_id, transcript is linked to gene by gene_id.

Transcript biotypes are defined in attributes named "**biotype**", "**transcript_biotype**" or "**transcript_type**". If none of these exist, Ensembl VEP will attempt to interpret the source field (2nd column) of the GTF as the biotype.

Here is an example:

```
1 Ensembl gene      1000  5000  . + . gene_id "genel"; gene_name "GENE1";
1 Ensembl transcript 1100  4900  . + . gene_id "genel"; transcript_id "transcript1"; gene_name

"exon2"; ccds_id "CDS0001";
```

Chromosome synonyms

If the chromosome names used in your GFF/GTF differ from those used in the FASTA or your input VCF, you may see warnings like this when running Ensembl VEP:

WARNING: Chromosome 21 not found in annotation sources or synonyms on line 160

To circumvent this you may provide Ensembl VEP with a [synonyms file](#). A synonym file is included in Ensembl VEP's cache files, so if you have one of these for your species you can use it as follows:

This website requires cookies, and the limited processing of your personal data in order to function. By using the site
 ~/.vep/homo_sapiens/116_GRCh38/chr_synonyms.txt
 you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

FASTA files

By pointing Ensembl VEP to a FASTA file (or directory containing several files), it is possible to retrieve reference sequence locally when using `--cache` or `--offline`. This enables Ensembl VEP to:

- Retrieve HGVS notations (`--hgvs`)
- Check the reference sequence given in input data (`--check_ref`)
- Construct transcript models from a GFF or GTF file without accessing a database (specially useful for performance reasons or if using data from species/assembly not part of [Ensembl species list](#))

FASTA files from Ensembl can be set up using the [installer](#); files set up using the installer are automatically detected when using `--cache` or `--offline`; you should not need to use `--fasta` to manually specify them.

The following plugins do require the fasta file to be explicitly passed as a command line argument (i.e. `--fasta /VEP_DIR/your_downloaded.fasta`)

- CSN
- GeneSplicer
- MaxEntScan

To enable this, Ensembl VEP uses one of two modules:

- The [Bio::DB::HTS](#) Perl XS module with [HTSLib](#). This module uses compiled C code and can access compressed (bgzipped) or uncompressed FASTA files. It is set up by the [installer](#).
- The [Bio::DB::Fasta](#) module. This may be used on systems where installation of the Bio::DB::HTS module has not been possible. It can access only uncompressed FASTA files. It is also set up by the installer and comes as part of the BioPerl package.

The first time you run Ensembl VEP with a specific FASTA file, an index will be built. This can take a few minutes, depending on the size of the FASTA file and the speed of your system. On subsequent runs the index does not need to be rebuilt (if the FASTA file has been modified, Ensembl VEP will force a rebuild of the index).

FASTA FTP directories

Suitable reference FASTA files are available to download from the Ensembl FTP server. See the [Downloads](#) page for details.

You should preferably use the installer as described above to fetch these files; manual instructions are provided for reference. In most cases it is best to download the single large "primary_assembly" file for your species. You should use the unmasked (without `_rm` or `_sm` in the name) sequences.

Note that Ensembl VEP requires that the file be either unzipped ([Bio::DB::Fasta](#)) or unzipped and then recompressed with bgzip ([Bio::DB::HTS::Faidx](#)) to run; when unzipped these files can be very large (25GB for human). An example set of commands for setting up the data for human follows:

```
curl -O https://ftp.ensembl.org/pub/release-116/fasta/homo_sapiens/dna/Homo_sapiens.GRCh38.dna.primary_assembly.fa.gz
gzip -d Homo_sapiens.GRCh38.dna.primary_assembly.fa.gz
bgzip Homo_sapiens.GRCh38.dna.primary_assembly.fa
./vep -i input.vcf --offline --hgvs --fasta Homo_sapiens.GRCh38.dna.primary_assembly.fa.gz
```

Databases

Ensembl VEP can use remote or local database servers to retrieve annotations.

- Using `--cache` (without `--offline`) uses the local cache on disk to fetch most annotations, but allows database connections for some features (see [cache limitations](#))

● Using `--database` tells Ensembl VEP to retrieve all annotations from the database. **Please only use this for small**
This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Public database servers

By default, Ensembl VEP is configured to connect to the public MySQL instance at ensembl.mysql.org. If you are in the USA (or geographically closer to the east coast of the USA than to the Ensembl data centre in Cambridge, UK), a mirror server is available at useastdb.ensembl.org. To use the mirror, use the flag `--host useastdb.ensembl.org`

Data for Ensembl Genomes species (e.g. plants, fungi, microbes) is available through a different public MySQL server. The appropriate connection parameters can be automatically loaded by using the flag `--genomes`

If you have a very small data set (100s of variants), using the public database servers should provide adequate performance. If you have larger data sets, or wish to use Ensembl VEP in a batch manner, consider one of the alternatives below.

Using a local database

It is possible to set up a local MySQL mirror with the databases for your species of interest installed. For instructions on installing a local mirror, see [here](#). You will need a MySQL server that you can connect to from the machine where you will run Ensembl VEP (this can be the same machine). For most annotation functionality, you will only need the Core database (e.g. `homo_sapiens_core_116_38`) installed. In order to find co-located variants or to use SIFT or PolyPhen-2, it is also necessary to install the relevant variation database (e.g. `homo_sapiens_variation_116_38`).

Note that unless you have custom data to insert in the database, in most cases it will be much more efficient to use a [pre-built cache](#) in place of a local database.

To connect to your mirror, you can either set the connection parameters using `--host`, `--port`, `--user` and `--password`, or use a registry file. Registry files contain all the connection parameters for your database, as well as any species aliases you wish to set up:

```
use Bio::EnsEMBL::DBSQL::DBAdaptor;
use Bio::EnsEMBL::Variation::DBSQL::DBAdaptor;
use Bio::EnsEMBL::Registry;

Bio::EnsEMBL::DBSQL::DBAdaptor->new(
  '-species' => "Homo_sapiens",
  '-group'   => "core",
  '-port'    => 5306,
  '-host'    => 'ensembl.mysql.org',
  '-user'    => 'anonymous',
  '-pass'    => '',
  '-dbname'  => 'homo_sapiens_core_116_38'
);

Bio::EnsEMBL::Variation::DBSQL::DBAdaptor->new(
  '-species' => "Homo_sapiens",
  '-group'   => "variation",
  '-port'    => 5306,
  '-host'    => 'ensembl.mysql.org',
  '-user'    => 'anonymous',
  '-pass'    => '',
  '-dbname'  => 'homo_sapiens_variation_116_38'
);

Bio::EnsEMBL::Registry->add_alias("Homo_sapiens", "human");
```

For more information on the registry and registry files, see [here](#).

Cache - technical information

ADVANCED The cache consists of compressed files containing listrefs of serialised objects. These objects are initially created from the database as if using the Ensembl API normally. In order to reduce the size of the cache and allow the serialisation to occur, some changes are made to the objects before they are dumped to disk. This means that they will not behave in exactly the same way as an object retrieved from the database when writing, for example, a plugin that uses the cache.

The following hash keys are deleted from each transcript object:

- `analysis`
- `created_date`

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- **dbentries** : this contains the external references retrieved when calling `$transcript->get_all_DBEntries()`; hence this call on a cached object will return no entries
- **description**
- **display_xref**
- **edits_enabled**
- **external_db**
- **external_display_name**
- **external_name**
- **external_status**
- **is_current**
- **modified_date**
- **status**
- **transcript_mapper** : used to convert between genomic, cdna, cds and protein coordinates. A copy of this is cached separately by Ensembl VEP as

```
$transcript->{_variation_effect_feature_cache}->{mapper}
```

As mentioned above, a special hash key `"_variation_effect_feature_cache"` is created on the transcript object and used to cache things used by Ensembl VEP in predicting consequences, things which might otherwise have to be fetched from the database. Some of these are stored in place of equivalent keys that are deleted as described above. The following keys and data are stored:

- **introns** : listref of intron objects for the transcript. The adaptor, analysis, dbID, next, prev and seqname keys are stripped from each intron object
- **translateable_seq** : as returned by

```
$transcript->translateable_seq
```

- **mapper** : transcript mapper as described above
- **peptide** : the translated sequence as a string, as returned by

```
$transcript->translate->seq
```

- **protein_features** : protein domains for the transcript's translation as returned by

```
$transcript->translation->get_all_ProteinFeatures
```

Each protein feature is stripped of all keys but: start, end, analysis, hseqname

- **codon_table** : the codon table ID used to translate the transcript, as returned by

```
$transcript->slice->get_all_Attributes('codon_table')->[0]
```

- **protein_function_predictions** : a hashref containing the keys "sift" and "polyphen"; each one contains a protein function prediction matrix as returned by e.g.

```
$protein_function_prediction_matrix_adaptor->fetch_by_analysis_translation_md5('sift',  
md5_hex($transcript->{_variation_effect_feature_cache}->{peptide}))
```

Similarly, some further data is cached directly on the transcript object under the following keys:

- **_gene** : gene object. This object has all keys but the following deleted: start, end, strand, stable_id
- **_gene_symbol** : the gene symbol
- **_ccds** : the CCDS identifier for the transcript
- **_refseq** : the "NM" RefSeq mRNA identifier for the transcript
- **_protein** : the Ensembl stable identifier of the translation

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- **_source_cache** : the source of the transcript object. Only defined in the merged cache (values: Ensembl, RefSeq) or when using a GFF/GTF file (value: short name or filename)

The Ensembl VEP package includes a tool, `filter_vep`, to filter results files on a variety of attributes.

It operates on standard, tab-delimited or VCF formatted output (NB only VCF output produced by Ensembl VEP or in the same format can be used).

Running `filter_vep`

Run as follows:

```
./vep -i in.vcf -o out.txt -cache -everything
./filter_vep -i out.txt -o out_filtered.txt -filter "[filter_text]"
```

`filter_vep` can also read from STDIN and write to STDOUT, and so may be used in a UNIX pipe:

```
./vep -i in.vcf -o stdout -cache -check_existing | ./filter_vep -filter "not Existing_variation" -
o out.txt
```

The above command removes known variants from the output

Options

Flag	Alternate	Description
-- help	-h	Print usage message and exit
-- input _file [file]	-i	Specify the input file (i.e. the Ensembl VEP results file). If no input file is specified, <code>filter_vep</code> will attempt to read from STDIN. Input may be gzipped - to read a gzipped file use --gz
-- forma t [form at]		Specify input file format: ● tab (i.e. the Ensembl VEP results file) ● vcf
-- outpu t_fil e [file]	-o	Specify the output file to write to. If no output file is specified, the <code>filter_vep</code> will write to STDOUT
-- force _over write		Force an output file of the same name to be overwritten
-- filte r [filt ers]	-f	Add filter (see below). Multiple --filter flags may be used, and are treated as logical ANDs, i.e. all filters must pass for a line to be printed

-- soft_ filter		Variants not passing given filters will be flagged in the FILTER column of the VCF file, and will not be removed from output.
-- list	-l	List allowed fields from the input file
-- count	-c	Print only a count of matched lines
-- only_ matched		In VCF files, the CSQ field that contains the consequence data will often contain more than one "block" of consequence data, where each block corresponds to a variant/feature overlap. Using <code>--only_matched</code> will remove blocks that do not pass the filters. By default, filter_vep prints out the entire VCF line if any of the blocks pass the filters.
-- vcf_ info_ field [key]		With VCF input files, by default filter_vep expects to find Ensembl VEP annotations encoded in the CSQ INFO key; Ensembl VEP itself can be configured to write to a different key (with the equivalent <code>--vcf_info_field</code> flag). Use this flag to change the INFO key Ensembl VEP expects to decode: e.g. use the command <code>--vcf_info_field ANN</code> if the Ensembl VEP annotations are stored in the INFO key "ANN".
-- ontol ogy	-y	Use Sequence Ontology to match consequence terms. Use with operator "is" to match against all child terms of your value. e.g. "Consequence is coding_sequence_variant" will match missense_variant, synonymous_variant etc. Requires database connection; defaults to connecting to ensembl.db.ensembl.org. Use <code>--host</code> , <code>--port</code> , <code>--user</code> , <code>--password</code> , <code>--version</code> as per <code>vep</code> to change connection parameters.

Writing filters

Filter strings consist of three components **that must be separated by whitespace**:

1. **Field** : A field name from the Ensembl VEP results file. This can be any field in the "main" columns of the output, or any in the "Extra" final column. For VCF files, this is any field defined in the "##INFO=<ID=CSQ" header. You can list available fields using `--list`. Field names are not case sensitive, and you may use the first few characters of a field name if they resolve uniquely to one field name.
2. **Operator** : The operator defines the comparison carried out.
3. **Value** : The value to which the content of the field is compared. May be prefixed with "#" to represent the value of another field.

Examples:

```
# match entries where Feature (Transcript) is "ENST00000307301"
--filter "Feature is ENST00000307301"

# match entries where Protein_position is less than 10
--filter "Protein_position < 10"

# match entries where Consequence contains "stream" (this will match upstream and downstream)
--filter "Consequence matches stream"
```

For certain fields you may only be interested in whether a value exists for that field; in this case the operator and value can be left out:

```
# filter for MANE transcripts
--filter "MANE"

# match entries where the gene symbol is defined
--filter "SYMBOL"
```

```
# match entries where AFR_AF is greater than EUR_AF
--filter "AFR_AF > #EUR_AF"
```

Filter strings can be linked together by the logical operators "or" and "and", and inverted by prefixing with "not":

```
# filter for missense variants in CCDS transcripts where the variant falls in a protein domain
--filter "Consequence is missense_variant and CCDS and DOMAINS"

# find variants where the allele frequency is greater than 10% in either AFR or EUR populations
--filter "AFR_AF > 0.1 or EUR_AF > 0.1"

# filter out known variants
--filter "not Existing_variation"
```

Filter logic may be constrained using parentheses, to any arbitrary level:

```
# find variants with AF > 0.1 in AFR or EUR but not EAS or SAS
--filter "(AFR_AF > 0.1 or EUR_AF > 0.1) and (EAS_AF < 0.1 and SAS_AF < 0.1)"
```

Note that for numeric fields, such as the *AF allele frequency fields, filter_vep does not consider the absence of a value for that field as equivalent to a 0 value. For example, if you wish to find rare variants by finding those where the allele frequency is less than 1% **or** absent, you should use the following:

```
--filter "AF < 0.01 or not AF"
```

You can use regex to do pattern match. For example, using `--sift b` in Ensembl VEP gives field value that has both string and number and looks like "tolerated(0.46)". To match on the string part, you can do the following:

```
# match string part
--filter "SIFT match tolerated"
```

For the Consequence field it is possible to use the [Sequence Ontology](#) to match terms ontologically; for example, to match all coding consequences (e.g. missense_variant, synonymous_variant):

```
--ontology --filter "Consequence is coding_sequence_variant"
```

Operators

- **is** (synonyms: = , eq) : Match exactly

```
# get only transcript consequences
--filter "Feature_type is Transcript"
```

- **!=** (synonym: ne) : Does not match exactly

```
# filter out tolerated SIFT predictions
--filter "SIFT != tolerated"
```

- **match** (synonyms: matches , re , regex) : Match string using regular expression. You may include any regular expression notation, e.g. "\d" for any numerical character

```
# match stop_gained, stop_lost and stop_retained
--filter "Consequence match stop"
```

- **<** (synonym: lt) : Less than. Note an absent value is not considered to be equivalent to 0.

```
# Find SIFT scores less than 0.1
--filter "SIFT < 0.1"
```

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- **>** (synonym: gt) : Greater than

```
# find variants not in the first exon
--filter "Exon > 1"
```

- **<=** (synonym: lte) : Less than or equal to. Note an absent value is not considered to be equivalent to 0.
- **>=** (synonym: gte) : Greater than or equal to
- **exists** (synonyms: ex , defined) : Field is defined - equivalent to using no operator and value
- **in** : Find in list or file. Value may be either a comma-separated list or a file containing values on separate lines. Each list item is compared using the "is" operator.

```
# find variants in a list of gene names
--filter "SYMBOL in BRCA1,BRCA2"

# filter using a file of MotifFeatures
--filter "Feature in /data/files/motifs_list.txt"
```

Ensembl VEP can integrate custom annotation from standard format files into your results by using the `--custom` flag.

These files may be hosted locally or remotely, with no limit to the number or size of the files. The files must be indexed using the [tabix](#) utility (BED, GFF, GTF, VCF); bigWig files contain their own indices.

Annotations typically appear as key=value pairs in the Extra column of the VEP output; they will also appear in the INFO column if using VCF format output. The value for a particular annotation is defined as the identifier for each feature; if not available, an identifier derived from the coordinates of the annotation is used. Annotations will appear in each line of output for the variant where multiple lines exist.

Data formats

Ensembl VEP supports the following annotation formats:

Format	Type	Description	Notes
GFF GTF	Gene/transcript annotations & GENCODE promoters	Formats to describe genes and other genomic features — format specifications: GFF3 and GTF	Requires a FASTA file in offline mode or if the desired species or assembly is not part of the Ensembl species list .
VCF	Variant data	A format used to describe genomic variants	Ensembl VEP uses the 3rd column as the identifier. INFO and FILTER fields from records may be added to the Ensembl VEP output.
BED	Basic/uninterpreted data	A simple tab-delimited format containing 3-12 columns of data. The first 3 columns contain the coordinates of the feature.	Ensembl VEP uses the 4th column (if available) as the feature identifier.
bigWig	Basic/uninterpreted data	A format for storage of dense continuous data.	Ensembl VEP uses the value for the given position as the identifier. BigWig files contain their own indices, and do not need to be indexed by tabix. Requires Bio::DB::BigFile .

Any other files can be easily converted to be compatible with Ensembl VEP; the easiest format to produce is a BED-like file containing coordinates and an (optional) identifier:

```
chr1    10000    11000    Feature1
chr3    25000    26000    Feature2
chrX    99000    99001    Feature3
```

Chromosomes can be denoted by either e.g. "chr7" or "7", "chrX" or "X".

Preparing files

Custom annotation files must be prepared in a particular way in order to work with tabix and therefore with Ensembl VEP. Files must be stripped of comment lines, sorted in chromosome and position order, compressed using bgzip and finally indexed using tabix. Here are some examples of that process for:

● GFF file

```
grep -v "#" myData.gff | sort -k1,1 -k4,4n -k5,5n -t$'\t' | bgzip -c > myData.gff.gz
tabix -p gff myData.gff.gz
```

● BED file

```
grep -v "#" myData.bed | sort -k1,1 -k2,2n -k3,3n -t$'\t' | bgzip -c > myData.bed.gz
tabix -p bed myData.bed.gz
```

The tabix utility has several preset filetypes that it can process, and it can also process any arbitrary filetype containing at least a chromosome and position column. See the [documentation](#) for details.

If you are going to use the file remotely (i.e. over HTTP or FTP protocol), you should ensure the file is world-readable on

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

Using positional options in `--custom` with VEP 109 and earlier (compatible with VEP 116)

Each custom file that you configure Ensembl VEP to use can be configured. Beyond the filepath, there are further options, each of which is specified in a comma-separated list, like this:

```
./vep [...] --custom  
Filename,Short_name,File_type,Annotation_type,Force_report_coordinates,VCF_fields
```

The options are as follows:

- **Filename :**

The path to the file. For tabix indexed files, the Ensembl VEP will check that both the file and the corresponding .tbi file exist. For remote files, Ensembl VEP will check that the tabix index is accessible on startup.

- **Short name :**

A name for the annotation that will appear as the key in the key=value pairs in the results.

If not defined, this will default to the annotation filename for the first set of annotation added (e.g. "myPhenotypes.bed.gz" in the second example below if the short name was missing).

- **File type :**

```
"bed", "gff", "gtf", "vcf" or "bigwig"
```

- **Annotation type :**

```
"exact" or "overlap" (if left blank, assumed to be overlap)
```

When using "exact" only annotations whose coordinates match exactly those of the variant will be reported. This would be suitable for position specific information such as conservation scores, allele frequencies or phenotype information. Using "overlap", any annotation that overlaps the variant by even 1bp will be reported.

- **Force report coordinates :**

```
"0" or "1" (if left blank, assumed to be 0)
```

If set to "1", this forces Ensembl VEP to output the coordinates of an overlapping custom feature instead of any found identifier (or value in the case of bigWig) field. If set to "0" (the default), Ensembl VEP will output the identifier field if one is found; if none is found, then the coordinates are used instead.

- **VCF fields :**

You can specify any info type (e.g. "AC") present in the INFO field of the custom input VCF or specify "FILTER" for the FILTER field, to add these as custom annotations:

- If using "exact" annotation type, allele-specific annotation will be retrieved.
- The INFO field name will be prefixed with the short name, e.g. using short name "test", the INFO field "foo" will appear as "test_FOO" in the Ensembl VEP output. Similarly FILTER field will appear as "test_FILTER".
- In VCF files the custom annotations are added to the CSQ INFO field.
- Alleles in the input and VCF entry are trimmed in both directions in an attempt to match complex or poorly formatted entries.

For example:

```
# BigWig file  
./vep [...] --custom frequencies.bw,Frequency,bigwig,exact,0  
# BED file  
./vep [...] --custom http://www.myserver.com/data/myPhenotypes.bed.gz,Phenotype,bed,exact,1  
# VCF file  
./vep [...] --custom  
https://ftp.ensembl.org/pub/data_files/homo_sapiens/GRCh37/variation_genotype/TOPMED_GRCh37.vcf.gz  
,vcf,exact,0,TOPMED
```

```
# For multiple custom files, use:
```

```
./vep [...] --custom clinvar.vcf.gz,ClinVar,vcf,exact,0,CLNSIG,CLNREVSTAT,CLNDN \
```

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Since Ensembl VEP 110, you can configure each custom file using a comma-separated list of key-value pairs:

```
./vep [...] --custom
file=Filename,short_name=Short_name,format=File_type,type=Annotation_type,fields=VCF_fields
```

The order of the options is irrelevant and most options have sensible defaults as described below:

Option	Accepted values	Description
file	String with valid path to file	(Required) Filename: The path to the file. For Tabix indexed files, Ensembl VEP will check if both the file and the corresponding index (<code>.tbi</code>) exist. For remote files, Ensembl VEP will check that the tabix index is accessible on startup.
format	bed, gff, gtf, vcf or bigwig	(Required) File format of file .
short_name	Annotation filename (default) or any string without commas	Short name: A name for the annotation that will appear as the key in the key=value pairs in the results. If not defined, this will default to the annotation filename.
fields		VCF fields: Percentage (%) separated list of INFO fields to print (such as <code>AC</code>) present in the custom input VCF or specify <code>FILTER</code> for the <code>FILTER</code> field, to add these as custom annotations: ● If using <code>exact</code> annotation type, allele-specific annotation will be retrieved. ● The INFO field name will be prefixed with the short name, e.g. using short name <code>test</code>, the INFO field <code>foo</code> will appear as <code>test_FOO</code> in the Ensembl VEP output. Similarly <code>FILTER</code> field will appear as <code>test_FILTER</code>. ● In VCF files the custom annotations are added to the CSQ INFO field. ● Alleles in the input and VCF entry are trimmed in both directions in an attempt to match complex or poorly formatted entries.
type	overlap (default), within, surrounding or exact	Annotation type: ● <code>overlap</code>: reports any annotation that overlaps the variant by even 1 base pair. ● <code>within (*)</code>: only reports annotations within the variant. ● <code>surrounding (*)</code>: only reports annotations that completely surround the variant. ● <code>exact</code>: only reports annotations whose coordinates match exactly those of the variant. This is suitable for position-specific information such as conservation scores, allele frequencies or phenotype information.
overlap_cutoff	From 0 (default) to 100	Minimum percentage overlap (*) between annotation and variant. See also reciprocal .
reciprocal	0 (default) or 1	Mode of calculating the overlap percentage (*): ● 0: percentage of annotation covered by variant ● 1: percentage of variant covered by annotation
distance	0 or a positive integer (disabled by default)	Distance (in base pairs) to the ends of the overlapping feature (*).
coords	0 (default) or 1	Force report coordinates: ● 0: outputs the identifier field (or value in the case of <code>bigWig</code>) if available; otherwise, outputs coordinates instead. ● 1: always outputs the coordinates of an overlapping custom feature.
same_type	0 (default) or 1	Only match identical variant classes (*). For instance, only match deletion

num_rec ords	50 (default), all, 0 or any positive integer	Number of matching records to display. Any remaining records are represented with ellipsis (. . .). Use num_records = all to display all matching records and num_records = 0 to only display . . . if there are matching records.
summary _stats	none (default), min, mean, max, count or sum	Summary statistics to display. A percentage-separated list may be used to calculate multiple summary statistics, such as min%mean%max%count%sum.
gff_t yp	transcript (default) or gencode_promoter	GFF feature type. Generally GFF files are parsed to extract and form gene/transcript object. Use gencode_promoter to extract GENCODE promoter windows .

When format = vcf, the features marked with (*) only work on structural variants.

Examples:

```
# BigWig file
./vep [...] --custom file=frequencies.bw,short_name=Frequency,format=bigwig,type=exact,coords=0
# BED file
./vep [...] --custom
file=http://www.myserver.com/data/myPhenotypes.bed.gz,short_name=Phenotype,format=bed,type=exact,c
ords=1
# VCF file
./vep [...] --custom
file=https://ftp.ensembl.org/pub/data_files/homo_sapiens/GRCh37/variation_genotype/TOPMED_GRCh37.v
cf.gz,format=vcf,type=exact,coords=0,fields=TOPMED
./vep [...] --custom
file=gnomad_v2.1_sv.sites.vcf.gz,short_name=gnomad,fields=PC%EVIDENCE%SVTYPE,format=vcf,type=withi
n,reciprocal=1,overlap_cutoff=80

# For multiple custom files, use:
./vep [...] --custom
file=clinvar.vcf.gz,short_name=ClinVar,format=vcf,type=exact,coords=0,fields=CLNSIG%CLNREVSTAT%CLN
DN \
    --custom
file=TOPMED_GRCh38_20180418.vcf.gz,short_name=topmed_20180418,format=vcf,type=exact,coords=0,field
s=TOPMED \
    --custom
file=UK10K_COHORT.20160215.sites.GRCh38.vcf.gz,short_name=uk10k,format=vcf,type=exact,coords=0,fi
lds=AF_ALSPAC
```

Example - ClinVar

We include the most recent public variant and phenotype data available in each Ensembl release, but some projects release data more frequently than we do.

If you want to have the very latest annotations, you can use the data files from your preferred projects (in any format listed in [Data formats](#)) and use them as a VEP custom annotation.

For instance, you can annotate your variants with Ensembl VEP, using the the latest ClinVar data as custom annotation. ClinVar provides VCF files on their FTP site: [GRCh37](#) and [GRCh38](#).

See below an example about how to use ClinVar VCF files as a Ensembl VEP custom annotation:

1. Download the VCF files (you need the compressed VCF file and the index file), e.g.:

```
# Compressed VCF file
curl -O https://ftp.ncbi.nlm.nih.gov/pub/clinvar/vcf_GRCh38/clinvar.vcf.gz
# Index file
curl -O https://ftp.ncbi.nlm.nih.gov/pub/clinvar/vcf_GRCh38/clinvar.vcf.gz.tbi
```

2. Example of command you can use:

```
./vep [...] --custom
file=clinvar.vcf.gz,short_name=ClinVar,format=vcf,type=exact,coords=0,fields=CLNSIG%CLNREVSTAT%CLN
DN
## Where the you are agreeing to this as outlined in our Privacy Policy and Terms of Use are:
# - CLNSIG: Clinical significance for this single variant
```

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

```
# - CLNREVSTAT: ClinVar review status for the Variation ID
# - CLNDN: ClinVar's preferred disease name for the concept specified by disease
identifiers in CLNDISDB
# Of course you can select the INFO fields you want in the ClinVar VCF file

# Quick example on GRCh38:
./vep --id "1 230710048 230710048 A/G 1" --species homo_sapiens -o /path/to/output/output.txt
--cache --offline --assembly GRCh38 --custom
file=/path/to/custom_files/clinvar.vcf.gz,short_name=ClinVar,format=vcf,type=exact,coords=0,file
lds=CLNSIG%CLNREVSTAT%CLNDN
```

+ Results in the default VEP format

```
## Column descriptions:
## Uploaded_variation : Identifier of uploaded variant
## Location : Location of variant in standard coordinate format (chr:start or chr:start-end)
## Allele : The variant allele used to calculate the consequence
## Gene : Stable ID of affected gene
## Feature : Stable ID of feature
## Feature_type : Type of feature - Transcript, RegulatoryFeature or MotifFeature
## Consequence : Consequence type
## cDNA_position : Relative position of base pair in cDNA sequence
## CDS_position : Relative position of base pair in coding sequence
## Protein_position : Relative position of amino acid in protein
## Amino_acids : Reference and variant amino acids
## Codons : Reference and variant codon sequence
## Existing_variation : Identifier(s) of co-located known variants
## Extra column keys:
## IMPACT : Subjective impact classification of consequence type
## DISTANCE : Shortest distance from variant to transcript
## STRAND : Strand of the feature (1/-1)
## FLAGS : Transcript quality flags
## SOURCE : Source of transcript
## ClinVar : /opt/vep/.vep/custom/clinvar.vcf.gz (exact)
## ClinVar_CLNSIG : CLNSIG field from /path/to/custom_files/clinvar.vcf.gz
## ClinVar_CLNREVSTAT : CLNREVSTAT field from /path/to/custom_files/clinvar.vcf.gz
## ClinVar_CLNDN : CLNDN field from /path/to/custom_files/clinvar.vcf.gz
#Uploaded_variation Location Allele Gene Feature Feature_type

Using remote files

The tabix utility makes it possible to read annotation files from remote locations, for example over HTTP or FTP protocols.

In order to do this, the .tbi index file is downloaded locally (to the current working directory) when Ensembl VEP is run. From this point on, only the portions of data requested by Ensembl VEP (i.e. those overlapping the variants in your input file) are downloaded.

bigWig files can also be used remotely in the same way as tabix-indexed files, although less stringent checks are carried out on Ensembl VEP startup.

Example - phyloP and phastCons conservation scores

The [UCSC Genome Browser](#) provides multiple alignment files with phyloP and phastCons conservation scores for different genomes in the BigWig (.bw) format.

These files can be remotely used as Ensembl VEP custom annotations by simply pointing to their URL. For instance, to include phyloP or phastCons 100 way conservation scores found in the [Downloads section](#) of the UCSC Genome Browser, you can use commands such as:

```
# Human GRCh38/hg38 phyloP100way scores
./vep [...] --custom
file=http://hgdownload.soe.ucsc.edu/goldenPath/hg38/phyloP100way/hg38.phyloP100way.bw,short_name=p
hyloP100way,format=bigwig

# Human GRCh38/hg38 phastCons100way scores
./vep [...] --custom
file=http://hgdownload.soe.ucsc.edu/goldenPath/hg38/phastCons100way/hg38.phastCons100way.bw,short_
name=phastCons100way,format=bigwig
```

Multiple files split by chromosome

Often large annotation files are split into several smaller files for each chromosome. In such cases you can run custom annotation on those files using a single `--custom` flag instead of separate ones for each file.

To do this, you need all the files to have the same name except for chromosome. When providing the `file` option replace the chromosome name with `###CHR###` placeholder.

For example, if you have separate gnomAD frequency files for each 24 chromosomes you can run:

```
# Human GRCh38/hg38 gnomAD frequency - there are total 24 files for each chromosome
./vep [...] --custom
file=gnomad.exomes.v4.1.sites.chr###CHR###.vcf.bgz,short_name=gnomade,fields=AF,format=vcf
```

You can use plugin modules written in Perl to **extend, filter and manipulate** the Ensembl VEP output.

To use plugins:

- Install them using the [Ensembl VEP installer script](#). You can quickly check installed plugins by running:

```
perl INSTALL.pl -a p -g list
```
- Use Ensembl VEP in [Docker](#) and [Singularity](#). The plugins and their dependencies are available in the [Docker image](#).

Existing plugins

We have written plugins to implement new functionalities that we do not (yet) include in the variation API, and these are stored in a public github repository:

https://github.com/Ensembl/VEP_plugins

Here is the list of the Ensembl VEP plugins available:

Select categories: 

Plugin	Description	Category	External libraries	Developer
AlphaMissense 	This plugin for the Ensembl Variant Effect Predictor (VEP) annotates missense variants with the pre-computed AlphaMissense pathogenicity scores. AlphaMissense is a deep learning model developed by Google DeepMind that predicts the pathogenicity of single nucleotide missense variants. This plugin will add two annotations per missense variant: • <code>am_pathogenicity</code>, a continuous score between 0 and 1 which can be interpreted as the predicted probability of the variant being pathogenic. • <code>am_class</code> is the classification of the variant into one of three discrete categories: <code>likely_pathogenic</code>, <code>likely_benign</code>, or <code>ambiguous</code>. These are derived using the following thresholds of <code>am_pathogenicity</code>: <code>likely_benign</code> if <code>am_pathogenicity < 0.34</code>; <code>likely_pathogenic</code> if <code>am_pathogenicity > 0.564</code>; <code>ambiguous</code> otherwise. These thresholds were chosen to achieve 90% precision for both pathogenic and benign ClinVar variants. Note that AlphaMissense was not trained on ClinVar variants. Variants labeled as <code>ambiguous</code> should be treated as <code>unknown</code> or <code>uncertain</code> according to AlphaMissense. This plugin is available for both GRCh37 (hg19) and GRCh38 (hg38) genome builds. The prediction scores of AlphaMissense can be downloaded from https://console.cloud.google.com/storage/browser/dm_alphamissense (AlphaMissense Database Copyright (2023) DeepMind Technologies Limited). Data contained within the AlphaMissense Database is licensed under the Creative Commons Attribution 4.0 International License (CC-BY) (the "License"). You may obtain a copy of the License at: https://creativecommons.org/licenses/by/4.0/legalcode. Use of the AlphaMissense Database is subject to Google Cloud Platform Terms of Service	Pathogenicity predictions	-	Ensembl

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

Disclaimer: The AlphaMissense Database and other information provided on or linked to this site is for theoretical modelling only, caution should be exercised in use. It is provided "as-is" without any warranty of any kind, whether express or implied. For clarity, no warranty is given that use of the information shall not infringe the rights of any third party (and this disclaimer takes precedence over any contrary provisions in the Google Cloud Platform Terms of Service). The information provided is not intended to be a substitute for professional medical advice, diagnosis, or treatment, and does not constitute medical or other professional advice.

Before running the plugin for the first time, you need to create a tabix index (requires tabix to be installed).

```
tabix -s 1 -b 2 -e 2 -f -S 1
AlphaMissense_hg38.tsv.gz
```

```
tabix -s 1 -b 2 -e 2 -f -S 1
AlphaMissense_hg19.tsv.gz
```

Options are passed to the plugin as key=value pairs:

Argument	Description
file	(mandatory) Tabix-indexed AlphaMissense data
cols	(optional) Colon-separated columns to print from AlphaMissense data; if set to all, all columns are printed (default: Missense_pathogenicity:Missense_class)
transcript_match	Only print data if transcript identifiers match those from AlphaMissense data (default: 0)

AlphaMissense predictions are matched to input data by genomic location and protein change by default.

Usage examples:

```
mv AlphaMissense.pm ~/.vep/Plugins

# print AlphaMissense scores and predictions
(default)
./vep -i variations.vcf --plugin
AlphaMissense,file=/full/path/to/file.tsv.gz

# print all AlphaMissense information
./vep -i variations.vcf --plugin
AlphaMissense,file=/full/path/to/file.tsv.gz,cols=all

# only report results for the transcripts in
the AlphaMissense prediction
./vep -i variations.vcf --plugin
AlphaMissense,file=/full/path/to/file.tsv.gz,transcript_match=1
```

AncestralAllel An Ensembl VEP plugin that retrieves ancestral allele sequences

Conservation

Ensembl

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

Ensembl produces FASTA file dumps of the ancestral sequences of key species. you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Plugin	Description	Category	External libraries	Developer
	• Data files for GRCh37: https://ftp.ensembl.org/pub/release-75/fasta/ancestral_alleles/ • Data files for GRCh38: https://ftp.ensembl.org/pub/current_fasta/ancestral_alleles/ For optimal retrieval speed, you should pre-process the FASTA files into a single bgzipped file that can be accessed via <code>Bio::DB::HTS::Faidx</code> (installed by <code>INSTALL.pl</code> - see Ensembl/ensembl-vep repository): <pre>wget https://ftp.ensembl.org/pub/current_fasta/ancestral_alleles/homo_sapiens_ancestor_GRCh38.tar.gz tar xzf homo_sapiens_ancestor_GRCh38.tar.gz cat homo_sapiens_ancestor_GRCh38/*.fa bgzip -c > homo_sapiens_ancestor_GRCh38.fa.gz rm -rf homo_sapiens_ancestor_GRCh38/homo_sapiens_ancestor_GRCh38.tar.gz ./vep -i variations.vcf --plugin AncestralAllele,homo_sapiens_ancestor_GRCh38.fa.gz</pre> The plugin is also compatible with <code>Bio::DB::Fasta</code> and an uncompressed FASTA file. Note the first time you run the plugin with a newly generated FASTA file it will spend some time indexing the file. DO NOT INTERRUPT THIS PROCESS, particularly if you do not have <code>Bio::DB::HTS</code> installed. Special cases: • - represents an insertion • ? indicates the chromosome could not be looked up in the FASTA Usage examples: <pre>mv AncestralAllele.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin AncestralAllele,homo_sapiens_ancestor_GRCh38.fa.gz</pre>			

AVADA

Automatic VARIant evidence DAtabase is a novel machine learning tool that uses natural language processing to automatically identify pathogenic genetic variant evidence in full-text primary literature about monogenic disease and convert it to genomic coordinates.

Please cite the AVADA publication alongside Ensembl VEP if you use this resource: <https://pubmed.ncbi.nlm.nih.gov/31467448/>

NB: The plugin currently does not annotate for `downstream_gene_variant` and `upstream_gene_variant`.

Pre-requisites

1. AVADA data is available for GRCh37 and can be downloaded from: http://bejerano.stanford.edu/AVADA/avada_v1.00_2016.vcf.gz

Phenotype data and citations

[List::MoreUtils](#)  `qw(uniq)`

Ensembl

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

[2016.vcf.gz](#)

2. The file needs to be tabix indexed. You can do this by following commands:

```
gzip -d avada_v1.00_2016.vcf.gz
bgzip avada_v1.00_2016.vcf
tabix avada_v1.00_2016.vcf.gz
```

3. As you have already noticed, tabix utility must be installed in your path to use this plugin.

The plugin can then be run to retrieve AVADA annotations. By default, the variants are matched with the HGNC gene symbol

```
./vep -i variations.vcf --plugin
AVADA,file=path/to/file
```

The output always includes one of the following columns depending on the option passed:

- AVADA_PMIID: PubMed ID evidence for the variant as reported by AVADA
- AVADA_PMIID_WITH_VARIANT: PubMed ID evidence for the variant as reported by AVADA along with the original variant string
- AVADA_PMIID_WITH_FEATURE: PubMed ID evidence for the variant as reported by AVADA along with feature id
- AVADA_PMIID_WITH_FEATURE_AND_VARIANT: PubMed ID evidence for the variant as reported by AVADA along with feature id and original variant string

The plugin can optionally be run by specifying the feature to match with.

In order to match by HGNC gene symbol:

```
./vep -i variations.vcf --plugin
AVADA,file=path/to/file,feature_match_by=gene_symbol
```

In order to match by Ensembl gene identifier :

```
./vep -i variations.vcf --plugin
AVADA,file=path/to/file,feature_match_by=ensembl_gene_id
```

In order to match by RefSeq identifier :

```
./vep -i variations.vcf --plugin
AVADA,file=path/to/file,feature_match_by=refseq_id
```

The plugin can also be run to report the original variant string reported in the publication.

```
./vep -i variations.vcf --plugin
AVADA,file=path/to/file,original_variant_string=1
```

Plugin	Description	Category	External libraries	Developer
Usage examples: <pre> ./vep -i variations.vcf --plugin AVADA, file=path/to/file ./vep -i variations.vcf --plugin AVADA, file=path/to/file, feature_match_by= <gene_symbol ensembl_gene_id refseq_id> </pre>				
BayesDel	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that adds the BayesDel scores to Ensembl VEP output. BayesDel is a deleteriousness meta-score combining multiple deleteriousness predictors to create an overall score. It works for coding and non-coding variants, single nucleotide variants and small insertion/deletions. The range of the score is from -1.29334 to 0.75731. The higher the score, the more likely the variant is pathogenic. For more information please visit: https://fenglab.chpc.utah.edu/BayesDel/BayesDel.html Please cite the BayesDel publication alongside Ensembl VEP if you use this resource: https://onlinelibrary.wiley.com/doi/full/10.1002/humu.23158 BayesDel pre-computed scores can be downloaded from https://drive.google.com/drive/folders/1K4LI6ZSsUGBhHoChUtegC8bgCt7hbQIA Note: These files only contain pre-computed BayesDel scores for missense variants for assembly GRCh37. For GRCh37: <pre> tar zxvf BayesDel_170824_addAF.tgz rm *.gz.tbi gunzip *.gz for f in BayesDel_170824_addAF_chr*; do grep -v "^#" \$f >> BayesDel_170824_addAF.txt; done cat BayesDel_170824_addAF.txt sort -k1,1 - k2,2n > BayesDel_170824_addAF_sorted.txt grep "^#" BayesDel_170824_addAF_chr1 > BayesDel_170824_addAF_all_scores.txt cat BayesDel_170824_addAF_sorted.txt >> BayesDel_170824_addAF_all_scores.txt bgzip BayesDel_170824_addAF_all_scores.txt tabix -s 1 -b 2 -e 2 BayesDel_170824_addAF_all_scores.txt.gz </pre> For GRCh38: Remap GRCh37 file The tabix utility must be installed in your path to use this plugin. Usage examples: <pre> mv BayesDel.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin BayesDel, file=/path/to/BayesDel/BayesDel_170824 _addAF_all_scores.txt.gz </pre>	Pathogenicity predictions	-	Ensembl
Blosum62	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that looks up the BLOSUM 62 substitution matrix score for the reference and alternative amino acids predicted for a missense mutation. It adds one new entry to the output, BLOSUM62, which is the associated score.	Conservation	-	Ensembl
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
	<pre>mv Blosum62.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin Blosum62</pre>			
CADD  Combined Annotation Dependent Depletion	An Ensembl VEP plugin that retrieves CADD scores for variants from one or more tabix-indexed CADD data files. Please cite the CADD publication alongside Ensembl VEP if you use this resource: https://www.ncbi.nlm.nih.gov/pubmed/24487276 The tabix utility must be installed in your path to use this plugin. The CADD SNV and indels data files (and respective Tabix index files) can be downloaded from - http://cadd.gs.washington.edu/download The CADD SV data files (and respective Tabix index files) can be downloaded from - https://kircherlab.bihealth.org/download/CADD-SV/v1.1/ By default the plugin is designed to not annotate SV variant if a SNV and/or indels CADD annotation file is provided. Because it can results in too many lines matched from the annotation files and increase run time exponentially. You can override this behavior by providing <code>force_annotate=1</code> which will force the plugin to annotate with the expense of increasing runtime. The plugin works with all versions of available CADD files. The plugin only reports scores and does not consider any additional annotations from a CADD file. It is therefore sufficient to use CADD files without the additional annotations. Usage examples: <pre>mv CADD.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin CADD,snv=/FULL_PATH_TO_CADD_FILE/whole_genome_SNVs.tsv.gz,indels=/FULL_PATH_TO_CADD_FILE/InDels.tsv.gz ./vep -i structural_variations.vcf --plugin CADD,sv=/FULL_PATH_TO_CADD_FILE/1000G_phase3_SV.s.tsv.gz ./vep -i structural_variations.vcf --plugin CADD,snv=/FULL_PATH_TO_CADD_FILE/whole_genome_SNVs.tsv.gz,indels=/FULL_PATH_TO_CADD_FILE/InDels.tsv.gz,force_annotate=1</pre>	Pathogenicity predictions	-	Ensembl
CAPICE 	An Ensembl VEP plugin that retrieves CAPICE scores for variants from one or more tabix-indexed CAPICE data files, in order to predict their pathogenicity. Please cite the CAPICE publication alongside Ensembl VEP if you use this resource: https://pubmed.ncbi.nlm.nih.gov/32831124/ The tabix utility must be installed in your path to use this plugin. The CAPICE SNVs, InDels and respective index (TBI) files for GRCh37 can be downloaded from https://zenodo.org/record/3928295 To filter results, please use <code>filter_vep</code> with the output file or standard output. Documentation on <code>filter_vep</code> is available at: https://www.ensembl.org/info/docs/tools/vep/script/vep_filter.html For recommendations on threshold selection, please read the CAPICE publication.	Pathogenicity predictions	-	Ensembl
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
	<pre>mv CAPICE.pm ~/.vep/Plugins # Download CAPICE SNVs, InDels and index (TBI) # files to the same path # - capice_v1.0_build37_indels.tsv.gz # - capice_v1.0_build37_indels.tsv.gz.tbi # - capice_v1.0_build37_snvs.tsv.gz # - capice_v1.0_build37_snvs.tsv.gz.tbi ./vep -i variations.vcf --plugin CAPICE,snv=/FULL_PATH_TO_CAPICE_FILE/capice_v1. 0_build37_snvs.tsv.gz,indels=/FULL_PATH_TO_CAPI CE_FILE/capice_v1.0_build37_indels.tsv.gz ./filter_vep -i variant_effect_output.txt -- filter "CAPICE_SCORE >= 0.02"</pre>			
Carol 	An Ensembl VEP plugin that calculates the Combined Annotation score (CAROL) score (1) for a missense mutation based on the pre-calculated SIFT (2) and PolyPhen-2 (3) scores from the Ensembl API (4). It adds one new entry to the output, CAROL, which is the calculated CAROL score. Note that this module is a perl reimplementation of the original R script, available at: https://sanger.ac.uk/tool/carol/ I believe that both versions implement the same algorithm, but if there are any discrepancies the R version should be treated as the reference implementation. Bug reports are welcome. References: 1. Lopes MC, Joyce C, Ritchie GRS, John SL, Cunningham F, Asimit J, Zeggini E. A combined functional annotation score for non-synonymous variants Human Heredity 73(1):47-51 (2012) doi:10.1159/000334984  2. Kumar P, Henikoff S, Ng PC. Predicting the effects of coding non-synonymous variants on protein function using the SIFT algorithm Nature Protocols 4(8):1073-1081 (2009) doi:10.1038/nprot.2009.86  3. ClinPred 	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that adds pre-calculated scores from ClinPred. ClinPred is a prediction tool to identify disease-relevant nonsynonymous variants. Please cite the ClinPred publication alongside Ensembl VEP if you use this resource: https://www.sciencedirect.com/science/article/pii/S0002929718302714 ClinPred scores can be downloaded from https://sites.google.com/site/clinpred/download	Pathogenicity predictions	-	Ensembl
This website requires cookies, and the limited processing of your personal data in order to function. By using the site before running the plugin: you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

For GRCh37:

```
gzip -d ClinPred.txt.gz # to unzip the text
file
cat ClinPred.txt | tr " " "\t" >
ClinPred_tabbed.tsv # change to tab-delimited
file
sed -i '1s/./#&/' ClinPred_tabbed.tsv #
comment the first line
sed -i 1s/Chr/chr/ ClinPred_tabbed.tsv #
convert Chr to chr
bgzip ClinPred_tabbed.tsv
tabix -f -s 1 -b 2 -e 2 ClinPred_tabbed.tsv.gz
```

For GRCh38:

```
gzip -d ClinPred_hg38.txt.gz # unzip the text
file
awk '($2 == "Start" || $2 ~ /^[0-9]+$/{print
$0} ' ClinPred_hg38.txt >
"ClinPred_hg38_tabbed.tsv" # remove problematic
lines
sed -i '1s/./#&/' ClinPred_hg38_tabbed.tsv #
comment the first line
sed -i 1s/Chr/chr/ ClinPred_hg38_tabbed.tsv #
convert Chr to chr
```

```
{ head -n 1 ClinPred_hg38_tabbed.tsv; tail -n +2
ClinPred_hg38_tabbed.tsv | sort -k1,1V -k2,2V; }>
ClinPred_hg38_sorted_tabbed.tsv # sort file by chromosome and
position
```

```
bgzip ClinPred_hg38_sorted_tabbed.tsv
tabix -f -s 1 -b 2 -e 2
ClinPred_hg38_sorted_tabbed.tsv.gz
```

The tabix utility must be installed in your path to use this plugin.
Check <https://github.com/samtools/htslib.git> for instructions.

Usage examples:

```
mv ClinPred.pm ~/.vep/Plugins
./vep -i variations.vcf --plugin
ClinPred,file=ClinPred_tabbed.tsv.gz
```

[Condel](#)

An Ensembl VEP plugin that calculates the Consensus Deleteriousness (Condel) score (1) for a missense mutation based on the pre-calculated SIFT (2) and PolyPhen-2 (3) scores from the Ensembl API (4).

It adds one new entry to the output, Condel, which is the calculated Condel score. This version of Condel was developed by the Biomedical Genomics Group of the Universitat Pompeu Fabra, at the Barcelona Biomedical Research Park and available at <https://bg.upf.edu/condel>. The code in this plugin is based on a script provided by this group and slightly reformatted to fit into the Ensembl API.

The plugin takes 3 command line arguments by this order:

Pathogenicity
predictions

-

Ensembl

Plugin	Description	Category	External libraries	Developer
	2. Output: output the Condel score (s), prediction (p) or both (b); both (b) is the default. 3. Version of Condel to use: either 1 (original version) or 2 (newer version); 2 is the default and is recommended to avoid false positive predictions from Condel in some circumstances. An example Condel configuration file and a set of distribution files can be found in the <code>config/Condel</code> directory in this repository. You should edit the <code>config/Condel/config/condel_SP.conf</code> file and set the <code>condel.dir</code> parameter to the full path to the location of the <code>config/Condel</code> directory on your system. Conservation 	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that retrieves a conservation score from the Ensembl Compara databases for variant positions. You can specify the method link type and species sets as command line options, the default is to fetch GERP scores from the EPO 35 way mammalian alignment (please refer to the Compara documentation for more details of available analyses). If a variant affects multiple nucleotides the average score for the position will be returned, and for insertions the average score of the 2 flanking bases will be returned. If the MAX parameter is used, the maximum score of any of the affected bases will be reported instead. The plugin uses the ensembl-compara API module (optional, see http://www.ensembl.org/info/docs/api/index.html) or obtains data directly from BigWig files (optional, see https://ftp.ensembl.org/pub/current_compara/conservation_scores/) Usage examples: <pre>mv Conservation.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin Conservation,mammals ./vep -i variations.vcf --plugin Conservation,/path/to/bigwigfile.bw ./vep -i variations.vcf --plugin Conservation,/path/to/bigwigfile.bw,MAX</pre>	Conservation	Net::FTP 	Ensembl

Plugin	Description	Category	External libraries	Developer
	<pre>./vep -i variations.vcf --plugin Conservation,database,GERP_CONSERVATION_SCORE,mmamals</pre> <pre>./vep -i variations.vcf --plugin Conservation,database,GERP_CONSERVATION_SCORE,mmamals,MAX</pre>			
dbNSFP 	An Ensembl VEP plugin that retrieves data for missense variants from a tabix-indexed dbNSFP file. Please cite the dbNSFP publications alongside the VEP if you use this resource: A guide for version specific citations is available on their website here: https://www.dbnsfp.org/publications You must have the <code>Bio::DB::HTS</code> module or the tabix utility must be installed in your path to use this plugin. From v5.0 onwards, dbNSFP are kindly hosting Ensembl VEP ready files, which are available for download from https://www.dbnsfp.org/download The information below pertains to releases prior to v5.0 - ONLY REQUIRED FOR LEGACY DATA / VERSIONS ----- ----- About dbNSFP data files: ● Download dbNSFP files from https://sites.google.com/site/jpopgen/dbNSFP. ● There are two distinct branches of the files provided for academic and commercial usage. Please use the appropriate files for your use case. ● The file must be processed depending on dbNSFP release version and assembly (see commands below). We recommend using <code>-T</code> option with the sort command to specify a temporary directory with sufficient space. ● The resulting file must be indexed with tabix before use by this plugin (see commands below). For release 4.9c: <pre>version=4.9c wget https://dbnsfp.s3.amazonaws.com/dbNSFP\${version}.zip unzip dbNSFP\${version}.zip zcat dbNSFP\${version}_variant.chr1.gz head -n1 > h</pre> # GRCh38/hg38 data <pre>zgrep -h -v ^#chr dbNSFP\${version}_variant.chr* sort -k1,1 -k2,2n - cat h - bgzip -c > dbNSFP\${version}_grch38.gz tabix -s 1 -b 2 -e 2 dbNSFP\${version}_grch38.gz</pre> # GRCh37/hg19 data <pre>zgrep -h -v ^#chr dbNSFP\${version}_variant.chr* awk '\$8 != "."' sort -k8,8 -k9,9n - cat h - bgzip -c > dbNSFP\${version}_grch37.gz tabix -s 8 -b 9 -e 9 dbNSFP\${version}_grch37.gz</pre>	Pathogenicity predictions	<code>File::Basenam</code> e  <code>qw(basename)</code>	Ensembl

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

When running the plugin you must list at least one column to retrieve from the dbNSFP file, specified as parameters to the plugin, such as:

```
--plugin dbNSFP,/path/to/dbNSFP.gz,LRT_score,GERP++_RS
```

You may include all columns with `ALL`; this fetches a large amount of data per variant:

```
--plugin dbNSFP,/path/to/dbNSFP.gz,ALL
```

Tabix also allows the data file to be hosted on a remote server. This plugin is fully compatible with such a setup - simply use the URL of the remote file:

```
--plugin dbNSFP,http://my.files.com/dbNSFP.gz,col1,col2
```

The plugin replaces occurrences of `;` with `,` and `|` with `&`. However, some data field columns, e.g. `Interpro_domain`, use the replacement characters. We added a file with replacement logic for customising the required replacement of `;` and `|` in dbNSFP data columns. In addition to the default replacements (`;` to `,` and `|` to `&`) users can add customised replacements. Users can either modify the file `dbNSFP_replacement_logic` in the `VEP_plugins` directory or provide their own file as second argument when calling the plugin:

```
--plugin dbNSFP,/path/to/dbNSFP.gz,/path/to/dbNSFP_replacement_logic,LRT_score,GERP++_RS
```

Note that transcript sequences referred to in dbNSFP may be out of sync with those in the latest release of Ensembl; this may lead to discrepancies with scores retrieved from other sources.

If the dbNSFP README file is found in the same directory as the data file, column descriptions will be read from this and incorporated into the output file header.

The plugin matches rows in the tabix-indexed dbNSFP file on:

- genomic position
- alt allele
- aaref - reference amino acid
- aaalt - alternative amino acid

To match only on the genomic position and the alt allele use `pep_match=0`:

```
--plugin dbNSFP,/path/to/dbNSFP.gz,pep_match=0,col1,col2
```

Some fields contain multiple values, one per Ensembl transcript ID. By default all values are returned, separated by `;` in the default VEP output format. To return values only for the matched Ensembl transcript ID use `transcript_match=1`. This behaviour only affects transcript and protein fields, not transcript specific fields, and is unaffected.

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Plugin	Description	Category	External libraries	Developer
	<pre>--plugin dbNSFP,/path/to/dbNSFP.gz,transcript_match=1,col1,col2</pre> NB 1: Using this flag may cause no value to return if the version of the Ensembl transcript set differs between Ensembl VEP and dbNSFP. NB 2: MutationTaster entries are keyed on a different set of transcript IDs. Using the <code>transcript_match</code> flag with any MutationTaster field selected will have no effect i.e. all entries are returned. Information on corresponding transcript(s) for MutationTaster fields can be found using http://www.mutationtaster.org/ChrPos.html Usage examples: <pre>mv dbNSFP.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin dbNSFP,/path/to/dbNSFP.gz,col1,col2 ./vep -i variations.vcf --plugin dbNSFP,'consequence=ALL',/path/to/dbNSFP.gz,col1,col2 ./vep -i variations.vcf --plugin dbNSFP,'consequence=3_prime_UTR_variant&intron_variant',/path/to/dbNSFP.gz,col1,col2</pre>			
dbscSNV 	An Ensembl VEP plugin that retrieves data for splicing variants from a tabix-indexed dbscSNV file. Please cite the dbscSNV publication alongside Ensembl VEP if you use this resource: http://nar.oxfordjournals.org/content/42/22/13534 The Bio::DB::HTS perl library or tabix utility must be installed in your path to use this plugin. The dbscSNV data file can be downloaded from https://sites.google.com/site/jpopgen/dbNSFP. The file must be processed and indexed by tabix before use by this plugin. dbscSNV1.1 has coordinates for both GRCh38 and GRCh37; the file must be processed differently according to the assembly you use. <pre>wget ftp://dbnsfp:dbnsfp@dbnsfp.softgenetics.com/dbscSNV1.1.zip unzip dbscSNV1.1.zip head -n1 dbscSNV1.1.chr1 > h</pre> # GRCh38 <pre>cat dbscSNV1.1.chr* grep -v ^chr sort -k5,5 -k6,6n cat h - awk '\$5 != "."' bgzip -c > dbscSNV1.1_GRCh38.txt.gz tabix -s 5 -b 6 -e 6 -c c dbscSNV1.1_GRCh38.txt.gz</pre> # GRCh37 <pre>cat dbscSNV1.1.chr* grep -v ^chr cat h - bgzip -c > dbscSNV1.1_GRCh37.txt.gz tabix -s 1 -b 2 -e 2 -c c dbscSNV1.1_GRCh37.txt.gz</pre>	Splicing predictions	-	Ensembl
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
	Note that in the last command we tell tabix that the header line starts with "c"; this may change to the default of "#" in future versions of dbscSNV. Tabix also allows the data file to be hosted on a remote server. This plugin is fully compatible with such a setup - simply use the URL of the remote file: <pre>--plugin dbscSNV,http://my.files.com/dbscSNV.txt.gz</pre> Note that transcript sequences referred to in dbscSNV may be out of sync with those in the latest release of Ensembl; this may lead to discrepancies with scores retrieved from other sources. Usage examples: <pre>mv dbscSNV.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin dbscSNV,/path/to/dbscSNV1.1_GRCh38.txt.gz</pre>			

[DeNovo](#)

An Ensembl VEP plugin that identifies de novo variants in a VCF file. The plugin is not compatible with JSON output format.

Variant data

- [Cwd](#)
- [List::MoreUtils](#)
- [ls](#)
- [qw\(uniqu\)](#)

Ensembl

Options are passed to the plugin as key=value pairs:

Argument	Description
ped	Path to PED file (mandatory) The file is tab or white-space delimited with five mandatory columns: • family ID • individual ID • paternal ID • maternal ID • sex • phenotype (optional)
report_dir	Write files in report_dir (optional)
full_report	Set to 1 to report all types of variants (optional) By default, the plugin only reports de novo variants.

The plugin can then be run:

```
./vep -i variations.vcf --plugin
DeNovo,ped=samples.ped
./vep -i variations.vcf --plugin
DeNovo,ped=samples.ped,report_dir=path/to/dir
./vep -i variations.vcf --plugin
DeNovo,ped=samples.ped,report_dir=path/to/dir,full_report=1
```

Plugin	Description	Category	External libraries	Developer						
	DeNovo,ped=samples.ped ./vep -i variations.vcf --plugin DeNovo,ped=samples.ped,full_report=1									
DosageSensitivity	An Ensembl VEP plugin that retrieves haploinsufficiency and triplosensitivity probability scores for affected genes from a dosage sensitivity catalogue published in paper - https://www.sciencedirect.com/science/article/pii/S0092867422007887 Please cite the above publication alongside Ensembl VEP if you use this resource. This plugin returns two scores: ● pHaplo score gives the probability of a gene being haploinsufficient (deletion intolerant) ● pTripto score gives the probability of a gene being triploinsensitive (duplication intolerant) Pre-requisites: You need the compressed tsv file containing the dosage sensitivity score. The file Collins_rCNV_2022.dosage_sensitivity_scores.tsv.gz can be downloaded from here - https://zenodo.org/record/6347673/files/Collins_rCNV_2022.dosage_sensitivity_scores.tsv.gz Options are passed to the plugin as key=value pairs: <table><thead><tr><th>Argument</th><th>Description</th></tr></thead><tbody><tr><td>file</td><td>(mandatory) compressed tsv file containing dosage sensitivity scores</td></tr><tr><td>cover</td><td>set value to 1 (0 by default) to report scores only if the variant covers the affected feature completely (e.g. - a CNV that duplicates the gene). The feature is a gene if using --database otherwise it is a transcript.</td></tr></tbody></table> Usage examples: <pre>mv DosageSensitivity.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin DosageSensitivity,file=/FULL_PATH_TO/Collins_rCNV_2022.dosage_sensitivity_scores.tsv.gz ./vep -i variations.vcf --plugin DosageSensitivity,file=/FULL_PATH_TO/Collins_rCNV_2022.dosage_sensitivity_scores.tsv.gz,cover=1</pre>	Argument	Description	file	(mandatory) compressed tsv file containing dosage sensitivity scores	cover	set value to 1 (0 by default) to report scores only if the variant covers the affected feature completely (e.g. - a CNV that duplicates the gene). The feature is a gene if using --database otherwise it is a transcript.	Gene tolerance to change	-	Ensembl
Argument	Description									
file	(mandatory) compressed tsv file containing dosage sensitivity scores									
cover	set value to 1 (0 by default) to report scores only if the variant covers the affected feature completely (e.g. - a CNV that duplicates the gene). The feature is a gene if using --database otherwise it is a transcript.									
Downstream	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that predicts the downstream effects of a frameshift variant on the protein sequence of a transcript. It provides the predicted downstream protein sequence (including any amino acids overlapped by the variant itself), and the change in length relative to the reference protein. Note that changes in splicing are not predicted - only the existing translatable (i.e. spliced) sequence is used as a source of translation. Any variants with a splice site consequence type are ignored.	Nearby features	-	Ensembl						

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Plugin	Description	Category	External libraries	Developer
	In run in offline mode, using the flag --offline, a FASTA file is required. See: https://www.ensembl.org/info/docs/tools/vep/script/vep_cache.html#fasta Sequence may be incomplete without a FASTA file or database connection. Usage examples: <pre>mv Downstream.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin Downstream</pre>			
Draw 	An Ensembl VEP plugin that draws pictures of the transcript model showing the variant location. Takes five optional paramters: 1. File name stem for images 2. Image width in pixels (default: 1000px) 3. Image height in pixels (default: 100px) 4. Transcript ID - only draw images for this transcript 5. Variant ID - only draw images for this variant e.g. <pre>./vep -i variations.vcf --plugin Draw,myimg,2000,100</pre> Images are written to [file_stem]_[transcript_id]_[variant_id].png Requires GD library installed to run. Usage examples: <pre>mv Draw.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin Draw</pre>	Visualisation	- GD::Polygons  - GD 	Ensembl
Enformer 	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that adds pre-calculated Enformer predictions of variant impact on chromatin and gene expression. The predictions have been aggregated across all 896 spatial bins to generate 5313 features corresponding to track prediction changes in differnet assays and cell types. This plugin is available for GRCh37 and GRCh38 Please cite the Enformer publication alongside Ensembl VEP if you use this resource: https://www.nature.com/articles/s41592-021-01252-x GRCh38 scores were lifted over using CrossMap from the Enformer scores available here - https://console.cloud.google.com/storage/browser/dm-enformer/variant-scores/1000-genomes/enformer Enformer scores can be downloaded from https://ftp.ensembl.org/pub/current_variation/Enformer for GRCh37 and GRCh38. The plugin can then be run as default to retrieve SAD (SNP Activity	Regulatory impact	-	Ensembl

Plugin	Description	Category	External libraries	Developer
	<pre>./vep -i variations.vcf --assembly GRCh38 --plugin Enformer, file=/path/to/Enformer/data.vcf.gz</pre> or run with option to only retrieve the SAD (SNP Activity Difference (SAD) scores - main variant effect score computed as $\text{model}(\text{alternate_sequence}) - \text{model}(\text{reference_sequence})$ score <pre>./vep -i variations.vcf --assembly GRCh38 --plugin Enformer, file=/path/to/Enformer/data.vcf.gz, SAD=1</pre> or run with option to only retrieve the SAR (Same as SAD, by computing $\text{np.log2}(1 + \text{model}(\text{alternate_sequence})) - \text{np.log2}(1 + \text{model}(\text{reference_sequence}))$ score <pre>./vep -i variations.vcf --assembly GRCh38 --plugin Enformer, file=/path/to/Enformer/data.vcf.gz, SAR=1</pre> or run with option to also retrieve the principal component scores which are a reduced representation of a much bigger vector of the SAD and SAR after using principal component analysis (PCA) <pre>./vep -i variations.vcf --assembly GRCh38 --plugin Enformer, file=/path/to/Enformer/data.vcf.gz, PC=1</pre> The tabix utility must be installed in your path to use this plugin. Check https://github.com/samtools/htslib.git for instructions. Usage examples: <pre>mv Enformer.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin Enformer, file=Enformer_grch38.vcf.gz</pre>			

EVE	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that adds information from EVE (evolutionary model of variant effect). This plugin only report EVE scores for input variants and does not merge input lines to report on adjacent variants. It is only available for GRCh38. Please cite EVE publication alongside Ensembl VEP if you use this resource: https://www.nature.com/articles/s41586-021-04043-8 <pre>##### ##### # Get and prepare EVE data: script to merge all # VCFs from EVE dataset. # ##### ##### # EVE input file can be downloaded from # https://evemodel.org/api/proteins/bulk/download # Input: VCF files by protein (v) you are agreeing to this as outlined in our Privacy Policy and Terms of Use</pre>	Pathogenicity predictions	-	Ensembl

Plugin	Description	Category	External libraries	Developer
FATHMM 	An Ensembl VEP plugin that gets FATHMM scores and predictions for missense variants. You will need the fathmm.py script and its dependencies (Python, Python MySQLdb). You should create a "config.ini" file in the same directory as the fathmm.py script with the database connection options. More information about how to set up FATHMM can be found on the FATHMM website at https://github.com/HAShahab/fathmm A typical installation could consist of: <pre> wget https://raw.githubusercontent.com/HAShahab/fathmm/master/cgi-bin/fathmm.py wget http://fathmm.biocompute.org.uk/database/fathmm.v2.3.SQL.gz gunzip fathmm.v2.3.SQL.gz mysql -h[host] -P[port] -u[user] -p[pass] -e"CREATE DATABASE fathmm" mysql -h[host] -P[port] -u[user] -p[pass] -Dfathmm < fathmm.v2.3.SQL echo -e "[DATABASE]\nHOST = [host]\nPORT = [port]\nUSER = [user]\nPASSWD = [pass]\nDB = fathmm\n" > config.ini </pre> Usage examples: <pre> mv FATHMM.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin FATHMM, "python2 /path/to/fathmm/fathmm.py" </pre>	Pathogenicity predictions	-	Ensembl
FATHMM_MKL 	An Ensembl VEP plugin that retrieves FATHMM-MKL scores for variants from a tabix-indexed FATHMM-MKL data file. See https://github.com/HAShahab/fathmm-MKL for details. NB: The currently available data file is for GRCh37 only. Usage examples: <pre> mv FATHMM_MKL.pm ~/.vep/Plugins ./vep -i input.vcf --plugin FATHMM_MKL, fathmm-MKL_Current.tab.gz </pre>	Pathogenicity predictions	-	Ensembl

Plugin	Description	Category	External libraries	Developer
FlagLRG 	An Ensembl VEP plugin that retrieves the LRG ID matching either the RefSeq or Ensembl transcript IDs. You can obtain the <code>list_LRGs_transcripts_xrefs.txt</code> using: <pre>wget https://ftp.ebi.ac.uk/pub/databases/lrgex/list_LRGs_transcripts_xrefs.txt</pre> Usage examples: <pre>mv FlagLRG.pm ~/.vep/Plugins ./vep -i variants.vcf --plugin FlagLRG,/path/to/list_LRGs_transcripts_xrefs.tx t</pre>	External ID	Text::CSV 	Stephen Kazakoff
FunMotifs 	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that adds tissue-specific transcription factor motifs from FunMotifs to the output. Please cite the FunMotifs publication alongside Ensembl VEP if you use this resource. The preprint can be found at: https://www.biorxiv.org/content/10.1101/683722v1 FunMotifs files can be downloaded from: http://bioinf.icm.uu.se:3838/funmotifs/ At the time of writing, all BED files found through this link support GRCh37, however other assemblies are supported by the plugin if an appropriate BED file is supplied. The tabix utility must be installed in your path to use this plugin. Usage examples: <pre>mv FunMotifs.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin FunMotifs,/path/to/funmotifs/all_tissues.bed.gz ,uterus ./vep -i variations.vcf --plugin FunMotifs,/path/to/funmotifs/blood.funmotifs_so rted.bed.gz,fscore,dnase_seq</pre> Parameters Required: <pre>[0] : FunMotifs BED file [1]+ : List of columns to include within the output (e.g. fscore, skin, contactingdomain)</pre>	Motif	-	Ensembl
G2P  gene2phenotype	An Ensembl VEP plugin that uses G2P allelic requirements to assess variants in genes for potential phenotype involvement. The plugin has multiple configuration options, though minimally requires only the CSV file of G2P data. This Plugin is available for GRCh38 and GRCh37. For further information see: Thormann A, Halachev M, McLaren W, et al. Flexible and scalable diagnostic filtering of genomic variants using G2P with Ensembl VEP. Nature Communications. 2019 May;10(1):2373. doi:10.1038/s41467-019-10016-3. PMID: 31147538; PMCID: PMC6542828.	Phenotype data and citations	• Text::CSV  • Scalar::Util  qw(looks_like_number) • FileHandle  • List::Util  qw(any) • Cwd 	Ensembl

Plugin	Description	Category	External libraries	Developer																
	processes. For the G2P plugin we recommend using 4 forks (--fork 4). G2P data file: To run the plugin it is necessary to provide a data file either downloaded from G2P or PanelApp. The G2P file can be downloaded from: - Website https://www.ebi.ac.uk/gene2phenotype/download - API <a href="https://www.ebi.ac.uk/gene2phenotype/api/panel/<name>/download">https://www.ebi.ac.uk/gene2phenotype/api/panel/<name>/download; Accepted panel names are: Cancer, Cardiac, DD, Ear, Eye, Skeletal, Skin (or All to download all panels in the same file) Options are passed to the plugin as key=value pairs, (defaults in parentheses): <table><thead><tr><th>Argument</th><th>Description</th></tr></thead><tbody><tr><td>file</td><td>Path to G2P data file. The file needs to be uncompressed.</td></tr><tr><td>variant_include_list</td><td>A list of variants to include even if variants do not pass allele frequency filtering. The include list needs to be a sorted, bgzipped and tabixed VCF file.</td></tr><tr><td>af_monogenic</td><td>maximum allele frequency for inclusion for monoallelic genes (0.0001)</td></tr><tr><td>af_biallelic</td><td>maximum allele frequency for inclusion for biallelic genes (0.005)</td></tr><tr><td>confidence_levels</td><td>Confidence levels include: definitive, strong, moderate, limited Former confidence terms are still supported: confirmed, probable, possible, both RD and IF. Separate multiple values with &. https://www.ebi.ac.uk/gene2phenotype/terminology. Default levels are confirmed and probable.</td></tr><tr><td>all_confidence_levels</td><td>Set to 1 to include all confidence levels Setting the value to 1 will overwrite any confidence levels provided with the confidence_levels option.</td></tr><tr><td>af_from_mv</td><td>set value to 1 to include allele frequencies from VCF file. Specify the list of reference populations to include with --af_from_vcf_keys</td></tr></tbody></table>	Argument	Description	file	Path to G2P data file. The file needs to be uncompressed.	variant_include_list	A list of variants to include even if variants do not pass allele frequency filtering. The include list needs to be a sorted, bgzipped and tabixed VCF file.	af_monogenic	maximum allele frequency for inclusion for monoallelic genes (0.0001)	af_biallelic	maximum allele frequency for inclusion for biallelic genes (0.005)	confidence_levels	Confidence levels include: definitive, strong, moderate, limited Former confidence terms are still supported: confirmed, probable, possible, both RD and IF. Plugin	Description	Category	External libraries	Developer
	Argument af_from_vcf_keys VCF collections used for annotating variant alleles with observed allele frequencies. Allele frequencies are retrieved from VCF files. If af_from_vcf is set to 1 but no VCF collections are specified with --af_from_vcf_keys all available VCF collections are included. Available VCF collections: topmed, uk10k, gnomADe, gnomADe_r2.1.1, gnomADg, gnomADg_v3.1.2, gnomADev4.1, gnomADgv4.1. Separate multiple values with &. VCF collections contain the following populations: ● topmed - TOPMed (available for GRCh37 and GRCh38). ● uk10k - ALSPAC, TWINSUK (available for GRCh37 and GRCh38). ● gnomADe & 'gnomADe_r2.1.1 & gnomADev4.1 - gnomADe:AFR, gnomADe:ALL, gnomADe:AMR, gnomADe:ASJ, gnomADe:EAS, gnomADe:FIN, gnomADe:NFE, gnomADe:OTH, gnomADe:SAS (for GRCh37 and GRCh38 respectively). ● gnomADg & gnomADg_v3.1.2 & gnomADgv4.1 - gnomADg:AFR, gnomADg:ALL, gnomADg:AMR, gnomADg:ASJ, gnomADg:EAS, gnomADg:FIN, gnomADg:NFE, gnomADg:OTH (for GRCh37 and GRCh38 respectively). Need to use af_from_vcf parameter to use this option. only_vcf_freq set to 1 to only use frequency from vcf files, can only be set if af_from_vcf is set. N/B - frequency information may be lost if this option is used default_af default frequency of the input variant if no frequency data is found (0). This determines whether such variants are included; the value of 0 forces variants with no frequency data to be included as this is considered equivalent to having a frequency of 0. Set to 1 (or any value higher than af) to exclude them. types SO consequence types to include. Separate multiple values with & (splice_donor_variant, splice_acceptor_variant, stop_gained, frameshift_variant, stop_lost, initiator_codon_variant, inframe_insertion, inframe_deletion, missense_variant, coding_sequence_variant, start_lost, transcript_ablation, transcript_amplification, protein_altering_variant) log_dir write stats to log files in log_dir txt_report write all G2P complete genes and attributes to txt file html_report write all G2P complete genes and attributes to html file

Plugin	Description	Category	External libraries	Developer
	Argument epo rt filter_by_gene_symbol filter_consequence_match flag_consistent only_manane include_disease			

Argument

epo
rt

filter_by_gene_symbol
set to 1 if filter by gene symbol. Do not set if filtering by HGNC_id. This option is set to 1 when using PanelApp files.

filter_consequence_match
to only report variants where the VEP predicted consequence matches the G2P variant consequence (GenCC term). Accepted values are:

- broad: includes 'almost always', probable and possible matches
- strict: includes 'almost always' and probable matches More details in <https://europepmc.org/article/MED/37982373> See here for the list of supported variant consequences in G2P: <https://www.ebi.ac.uk/gene2phenotype/about/terminology#variant-consequence-section>

flag_consistent
flag if the VEP predicted consequence matches the G2P variant consequence (GenCC term). Accepted values are:

- broad: includes 'almost always', probable and possible matches
- strict: includes 'almost always' and probable matches More details in <https://europepmc.org/article/MED/37982373>

only_manane
set to 1 to ignore transcripts that are not MANE N/B - Information may be lost if this option is used.

include_disease
set to 1 to report the G2P disease name in the VEP output. The disease name is not included in the G2P report files.

For more information - <https://www.ebi.ac.uk/gene2phenotype/variant-filtering>

Example:

```
--plugin  
G2P, file=G2P.csv, af_monoallelic=0.05, types=stop  
_gained&frameshift_variant  
--plugin  
G2P, file=G2P.csv, af_monoallelic=0.05, types=stop  
_gained&frameshift_variant  
f=1  
--you are agreeing to this as outlined in our Privacy Policy and Terms of Use
```

GeneBe	A user-contributed Ensembl VEP plugin that retrieves automatic ACMG variant classification data from https://genebe.net/ Please cite the GeneBe publication alongside Ensembl VEP if you use this resource: https://onlinelibrary.wiley.com/doi/10.1111/cge.14516 . Please be advised that the GeneBe API is freely accessible for academic purposes only, with a limited number of queries per day, albeit at a high threshold. Kindly utilize this resource judiciously to ensure its availability for others. For further information, please visit https://genebe.net/about/api. In order to extend your daily limits please make an account on https://genebe.net/ and use your username and API-key as follows: <pre>./vep -i variations.vcf --plugin GeneBe, user=example@email.com, password=your_api _key</pre> Usage examples: <pre>mv GeneBe.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin GeneBe</pre>	Variant data	JSON	- Ensembl - Piotr Stawinski
GeneSplice	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that runs GeneSplicer (https://ccb.jhu.edu/software/genesplicer/) to get splice site predictions. It evaluates a tract of sequence either side of and including the variant, both in reference and alternate states. The amount of sequence included either side defaults to 100bp, but can be modified by passing e.g. "context=50" as a parameter to the plugin. You will need to download the GeneSplicer binary and data from ftp://ftp.ccb.jhu.edu/pub/software/genesplicer/GeneSplicer.tar.gz. Extract the folder using: <pre>tar -xzf GeneSplicer.tar.gz</pre> GeneSplicer comes with precompiled binaries for multiple systems. If the provided binaries do not run, compile <code>genesplicer</code> from source:	Splicing predictions	Digest::MD5	Ensembl
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

```
[[ $(uname -s) == "Darwin" ]] && perl -pi -e
"s/^main /int main /" genesplicer.cpp
make
cd -
./vep [options] --plugin
GeneSplicer,$GS/sources/genesplicer,$GS/human
```

Predicted splicing regions that overlap the variant are reported in the output with a `/-separated` string (e.g., `loss/acceptor/727006-727007/High/16.231924`) consisting of the following data by this order:

1. state (no_change, diff, gain, loss)
2. type (donor, acceptor)
3. coordinates (start-end)
4. confidence (Low, Medium, High)
5. score

If multiple sites are predicted, their reports are separated by `","`.

For diff, the confidence and score for both the reference and alternate sequences is reported as REF-ALT, such as `diff/donor/621915-621914/Medium-Medium/7.020731-6.988368`.

Several key=value parameters can be modified in the the plugin string:

Argument	Description
training	(mandatory) directory to species-specific training data, such as GeneSplicer/human
binary	path to genesplicer binary (default: genesplicer)
context	change the amount of sequence added either side of the variant (default: 100bp)
tmpdir	change the temporary directory used (default: /tmp)
cache_size	change how many sequences' scores are cached in memory (default: 50)

Example:

```
--plugin
GeneSplicer,binary=$GS/bin/linux/genesplicer,training=$GS/human,context=200,tmpdir=/mytmp
```

When using Ensembl VEP Docker/Singularity, the `binary` argument can be omitted, as the `genesplicer` command is exported in the `$PATH` variable and is thus automatically detected by the plugin:

```
--plugin
GeneSplicer,training=$GS/human,context=200,tmpdir=/mytmp
```

	<pre>gnomad/release/2.1/coverage/genomes/gnomad.genomes.coverage.summary.tsv.bgz --no-check-certificate</pre> gnomad exomes: <pre>wget https://storage.googleapis.com/gcp-public-data--gnomad/release/2.1/coverage/exomes/gnomad.exomes.coverage.summary.tsv.bgz --no-check-certificate</pre> for Assembly GRCh38: gnomad genomes: <pre>wget https://storage.googleapis.com/gcp-public-data--gnomad/release/3.0.1/coverage/genomes/gnomad.genomes.r3.0.1.coverage.summary.tsv.bgz --no-check-certificate</pre> Necessary before using the plugin for Assembly GRCh37: The following steps are necessary to tabix the gnomad genomes coverage file : <pre>gunzip -c gnomad.genomes.coverage.summary.tsv.bgz sed 'ls/*/#&/' > gnomad.genomes.tabbed.tsv bgzip gnomad.genomes.tabbed.tsv tabix -s 1 -b 2 -e 2 gnomad.genomes.tabbed.tsv.gz</pre> The following steps are necessary to tabix the gnomad exomes coverage file : <pre>gunzip -c gnomad.exomes.coverage.summary.tsv.bgz sed 'ls/*/#&/' > gnomad.exomes.tabbed.tsv bgzip gnomad.exomes.tabbed.tsv tabix -s 1 -b 2 -e 2 gnomad.exomes.tabbed.tsv.gz</pre> for Assembly GRCh38: The following steps are necessary to tabix the gnomad genomes coverage file : <pre>gunzip -c gnomad.genomes.r3.0.1.coverage.summary.tsv.bgz sed 'ls/*/#&/' > gnomad.genomesv3.tabbed.tsv sed "ls/locus/chr\tpos/; s:/\t/g" gnomad.genomesv3.tabbed.tsv > gnomad.ch.genomesv3.tabbed.tsv bgzip gnomad.ch.genomesv3.tabbed.tsv tabix -s 1 -b 2 -e 2 gnomad.ch.genomesv3.tabbed.tsv</pre> This plugin also tries to be backwards compatible with older versions of the coverage summary files, including releases 2.0.1 and 2.0.2. These releases provide one coverage file per chromosome and these can be used "as-is" without requiring any preprocessing.			
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

You must have the Bio::DB::HTS module or the tabix utility must be installed in your path to use this plugin.

Usage examples:

```
mv gnomADc.pm ~/.vep/Plugins
./vep -i variations.vcf --plugin
gnomADc,/path/to/gnomad.tsv.gz
```

gnomADMit

An Ensembl VEP plugin that retrieves allele frequencies for mitochondrial variants from the gnomAD genomes mitochondrial annotations files, available here: <https://gnomad.broadinstitute.org/downloads#v3-mitochondrial-dna>

Frequency data

List::Util qw(max)

Ensembl

Options are passed to the plugin as key=value pairs:

Arg	Description
file	(mandatory) Tabix-indexed VCF file from gnomAD
fields	(optional) Colon-separated list of information from mitochondrial variants to output (default: hap_AC_hom:hap_AC_het:hap_AF_hom:hap_AF_het:hap_AN); keyword all can be used to print all fields; Available fields are the names of INFO fields.
haplogroups	(optional) Colon-separated list of haplogroups to limit returned haplogroup field data to. The order of the list is preserved in the output. Example: HV:A:B. By default, data for all haplogroups is returned for all haplogroup fields (/hap_+/).
populations	(optional) Colon-separated list of populations to limit returned population field data to. The order of the list is preserved in the output. Example: eas:fin:afr. By default, data for all populations is returned for all population fields (/pop_+/).

To download the gnomad Mitochondrial allele annotations file in VCF format (GRCh38 based) and the corresponding index file:

```
wget https://storage.googleapis.com/gcp-public-data--gnomad/release/3.1/vcf/genomes/gnomad.genomes.v3.1.sites.chrM.vcf.bgz --no-check-certificate
wget https://storage.googleapis.com/gcp-public-data--gnomad/release/3.1/vcf/genomes/gnomad.genomes.v3.1.sites.chrM.vcf.bgz.tbi --no-check-certificate
```

If you use this plugin, please see the terms and data information: <https://gnomad.broadinstitute.org/terms>

You must have the Bio::DB::HTS module or the tabix utility must be installed in your path to use this plugin.

Usage examples:

Plugin	Description	Category	External libraries	Developer
	<pre>gnomADMt, file=/path/to/gnomad.genomes.v3.1.site s.chrM.vcf.bgz # Only return (haplotype-)grouped data for the specified haplogroups ./vep -i variations.vcf --plugin gnomADMt, file=/path/to/gnomad.genomes.v3.1.site s.chrM.vcf.bgz, hap_filter=HV:A:B # Only return population-grouped data for the specified populations ./vep -i variations.vcf --plugin gnomADMt, file=/path/to/gnomad.genomes.v3.1.site s.chrM.vcf.bgz, fields=pop_AC_hom:pop_AC_het:pop _AF_hom:pop_AF_het:pop_AN, pop_filter=eas:fin:af r</pre>			

Gene Ontology

An Ensembl VEP plugin that retrieves Gene Ontology (GO) terms associated with transcripts (e.g. GRCh38) or their translations (e.g. GRCh37) using custom GFF annotation containing GO terms.

Phenotype
data and
citations

-

Ensembl

The custom GFF files are automatically created if the input file do not exist by querying the Ensembl core database, according to database version, species and assembly used in Ensembl VEP. Note that automatic retrieval fails if using the --offline option.

The GFF files containing the GO terms are saved to and loaded from the working directory by default. To change this, provide a directory path as an argument:

```
--plugin GO, dir=${HOME}/go_terms
```

If your GFF file has a custom name, please provide the filename directly:

```
--plugin GO, file=${HOME}/custom_go_terms.gff.gz
```

The GO terms can also be fetched by gene match (either gene Ensembl ID or gene symbol) instead:

```
--plugin GO, match=gene
--plugin GO, match=gene_symbol
```

To create/use a custom GFF file, these programs must be installed in your path:

- The GNU zgrep and GNU sort commands to create the GFF file.
- The tabix and bgzip utilities to create and read the GFF file: check <https://github.com/samtools/htslib.git> for installation instructions.

Alternatively, for compatibility purposes, the plugin allows to use a remote connection to the Ensembl API by using "remote" as a parameter. This method retrieves GO terms one by one at both the transcript and translation level. This is not compatible with any other parameters:

```
--plugin GO, remote
```

Usage examples:

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Plugin	Description	Category	External libraries	Developer
	<pre> # automatically fetch GFF files with GO terms and annotate input with GO terms # not compatible with --offline option ./vep -i variations.vcf --plugin GO # set directory used to write and read GFF files with GO terms ./vep -i variations.vcf --plugin GO,dir=\${HOME}/go_terms # annotate input with GO terms from custom GFF file ./vep -i variations.vcf --plugin GO,file=\${HOME}/custom_go_terms.gff.gz # annotate input based on gene identifiers instead of transcripts/translations ./vep -i variations.vcf --plugin GO,match=gene # use remote connection (available for compatibility purposes) ./vep -i variations.vcf --plugin GO,remote </pre>			

GWAS

An Ensembl VEP plugin that retrieves relevant NHGRI-EBI GWAS Catalog data given the file.

This plugin supports both the curated data that is found in the download section of the NHGRI-EBI GWAS Catalog website and the summary statistics file. By default the plugin assumes the file provided is the curated file but you can pass "type=sstate" to say you want to annotate with a summary statistics file.

Please cite the following publication alongside Ensembl VEP if you use this resource: <https://pubmed.ncbi.nlm.nih.gov/30445434/>

Pre-requisites:

For curated NHGRI-EBI GWAS Catalog file - GWAS files can be downloaded from - <https://www.ebi.ac.uk/gwas/api/search/downloads/alternative>

For summary statistics file - The plugin can process the harmonised version of the summary statistics file. Which can be downloaded from the FTP site - http://ftp.ebi.ac.uk/pub/databases/gwas/summary_statistics

They are under directory with related to their specific GCST id. For example - http://ftp.ebi.ac.uk/pub/databases/gwas/summary_statistics/GCST00001-GCST001000/GCST000028/harmonised/17463246-GCST000028-EFO_0001360.h.tsv.gz

Please keep the filename format as it is because filename is parsed to get information.

When run for the first time for either type of file, the plugin will create a processed file that have genomic locations and indexed and put it under the --dir location determined by Ensembl VEP. If db=1 option is used, depending on the file size it might take hour(s) to create the processed file. Subsequent runs will be faster as the plugin will be using the already generated processed file. This option is not used by default and the variant information is generally taken directly from the file provided.

Options are passed to the plugin as key-value pairs:

Phenotype

Default is "curated". verbose display info level messages. Valid values are 0 or 1. Default is 0. db get variant information from Ensembl database during creation of processed file. Valid values are 0 or 1. Default is 0 (variant information is retrieved from curated file)			
	Usage examples: <pre>mv GWAS.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin GWAS,file=/FULL_PATH_TO/gwas_catalog_v1.0.2- associations_e107_r2022-09-14.tsv ./vep -i variations.vcf --plugin GWAS,type=sstate,file=/FULL_PATH_TO/17463246- GCST000028-EFO_0001360.h.tsv.gz</pre>			
HGVSIntronOffset	An Ensembl VEP plugin for the Ensembl Variant Effect Predictor (VEP) that returns HGVS intron start and end offsets. To be used with --hgvs option. Usage examples: <pre>mv HGVSIntronOffset.pm ~/.vep/Plugins ./vep -i variants.vcf --hgvs --plugin HGVSIntronOffset</pre>	HGVS	-	Stephen Kazakoff
IntAct	An Ensembl VEP plugin that retrieves molecular interaction data for variants as reported by IntAct database. Please cite the IntAct publication alongside Ensembl VEP if you use this resource: https://pubmed.ncbi.nlm.nih.gov/24234451/ Pre-requisites: - IntAct files can be downloaded from - https://ftp.ebi.ac.uk/pub/databases/intact/current/variants - The genomic location mapped file needs to be tabix indexed. You can do this by following commands - a) filter, sort and then zip <pre>grep -v -e '^\$' -e '^[#\-\]' mutation_gc_map.txt sed '1s/./#&/' awk -F "\t" 'BEGIN { OFS="\t"} {if (\$2 > \$3) {a=\$2; \$2=\$3; \$3=a}; print \$0 }' sort -k1,1 -k2,2n -k3,3n bgzip > mutation_gc_map.txt.gz</pre>	Functional effect	-	Ensembl

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

```
tabix -s 1 -b 2 -e 3 -f mutation_gc_map.txt.gz
```

3. As you have already noticed, tabix utility must be installed in your path to use this plugin.

Options are passed to the plugin as key=value pairs:

Argument	Description
mapping_file	(mandatory) Path to tabix-indexed genomic location mapped file
mutation_file	(mandatory) Path to IntAct data file

By default the output will always contain feature_type and interaction_ac from the IntAct data file. You can also add more fields using the following key=value options -

Argument	Description
feature_ac	Set value to 1 to include Feature AC in the output
feature_short_label	Set value to 1 to include Feature short label in the output
feature_annotation	Set value to 1 to include Feature annotation in the output
ap_ac	Set value to 1 to include Affected protein AC in the output
interaction_participants	Set value to 1 to include Interaction participants in the output
pmid	Set value to 1 to include PubMedID in the output

There are also two other key=value options for customizing the output -

Argument	Description
all	Set value to 1 to include all the fields
minimal	Set value to 1 to overwrite default behavior and include only interaction_ac in the output by default

See what these options mean -

<https://www.ebi.ac.uk/intact/download/datasets#mutations>

Note that, interaction accession can be used to link to full details on the interaction website. For example, where the output reports an interaction_ac of EBI-12501485, the URL would be :

<https://www.ebi.ac.uk/intact/details/interaction/EBI-12501485>

Usage examples:

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Plugin	Description	Category	External libraries	Developer
	<pre>IntAct,mutation_file=/FULL_PATH_TO_IntAct_FILE/ mutations.tsv,mapping_file=/FULL_PATH_TO_IntAct _FILE/mutation_gc_map.txt.gz ./vep -i variations.vcf --plugin IntAct,mutation_file=/FULL_PATH_TO_IntAct_FILE/ mutations.tsv,mapping_file=/FULL_PATH_TO_IntAct _FILE/mutation_gc_map.txt.gz,minimal=1</pre>			
LD Linkage Disequilibrium	An Ensembl VEP plugin that finds variants in linkage disequilibrium with any overlapping existing variants from the Ensembl variation databases. You can configure the population used to calculate the r2 value, and the r2 cutoff used by passing arguments to the plugin via the command line (separated by commas). This plugin adds a single new entry to the Extra column with a comma-separated list of linked variant IDs and the associated r2 values: LinkedVariants=rs123:0.879,rs234:0.943 If no arguments are supplied, the default population used is the CEU sample from the 1000 Genomes Project phase 3, and the default r2 cutoff used is 0.8. WARNING: Calculating LD is a relatively slow procedure, so this will increase runtime considerably when running on large numbers of variants. Consider running vep followed by filter_vep to get a smaller input set: <pre>./vep -i input.vcf -cache -vcf -o input_vep.vcf ./filter_vep -i input_vep.vcf -filter "Consequence is missense_variant" > input_vep_filtered.vcf ./vep -i input_vep_filtered.vcf -cache -plugin LD</pre> Usage examples: <pre>mv LD.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin LD,1000GENOMES:phase_3:CEU,0.8 ./vep -i variations.vcf --plugin LD,'populations=1000GENOMES:phase_3:CEU&1000GEN OMES:phase_3:PUR&1000GENOMES:phase_3:STU',0.8</pre>	Variant data	-	Ensembl
LocalID	The LocalID plugin allows you to use variant IDs as input without making a database connection. Requires sqlite3. A local sqlite3 database is used to look up variant IDs; this is generated either from Ensembl's public database (very slow, but includes synonyms), or from Ensembl VEP cache file (faster, excludes synonyms). NB: this plugin is NOT compatible with the ensembl-tools variant_effect_predictor.pl version of Ensembl VEP. Usage examples: <pre>mv LocalID.pm ~/.vep/Plugins</pre>	Look up	-	Ensembl
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
	<pre> not required see next command ./vep -i variant_ids.txt --plugin LocalID,create_db=1 -safe # OR create from cache directory # faster but does not include synonyms # parameter passed to from_cache may be full path to cache e.g. \$HOME/.vep/homo_sapiens/88_GRCh38 # cache may be tabix converted or in default state (http://www.ensembl.org/info/docs/tools/vep/scr ipt/vep_cache.html#convert) ./vep -i variant_ids.txt --plugin LocalID,create_db=1,from_cache=1 -safe # subsequent runs ./vep -i variant_ids.txt --plugin LocalID # db file can be specified with db=[file] # default file name is \$HOME/.vep/[species]_[version]_[assembly].varia nt_ids.sqlite3 ./vep -i variant_ids.txt --plugin LocalID,db=my_db_file.txt </pre>			
LOEUF	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that adds the LOEUF scores to VEP output. LOEUF stands for the "loss-of-function observed/expected upper bound fraction." The score can be added matching by either transcript or gene. When matched by gene: If multiple transcripts are available for a gene, the most severe score is reported. NB: The plugin currently does not add the score for downstream_gene_variant and upstream_gene_variant Please cite the LOEUF publication alongside the VEP if you use this resource: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7334197/ LOEUF scores can be downloaded from GRCh37: https://gnomad.broadinstitute.org/downloads#v2-constraint (pLoF Metrics by Gene TSV) GRCh38: https://gnomad.broadinstitute.org/downloads#v4-constraint (Constraint metrics TSV) For GRCh37: These files can be tabix-processed by: <pre> zcat gnomad.v2.1.1.lof_metrics.by_gene.txt.bgz (head -n 1 && tail -n +2 sort -t\$'\t' -k 76,76 -k 77,77n) > loeuf_temp.tsv sed '1s/./#&/' loeuf_temp.tsv > loeuf_dataset.tsv bgzip loeuf_dataset.tsv tabix -f -s 76 -b 77 -e 78 loeuf_dataset.tsv.gz </pre> For GRCh38: The GRCh38 file does not have gene co-ordinates information. First you need to add the gene co-ordinates information. You can use the Ensembl Perl API to create a script and perform that - https://www.ensembl.org/info/docs/api/core/index.html. After adding the start and end position of the genes at the last 2 columns you can process the file as follows:	Gene tolerance to change	Scalar::Util qw(looks_like_number)	Ensembl
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
	<pre>tabix -f -s 114 -b 115 -e 116 loeuf_dataset_grch38.tsv.gz</pre> The processed file can be downloaded from: https://ftp.ensembl.org/pub/current/variation/LOEUF/loeuf_dataset_grch38.tsv.gz The tabix utility must be installed in your path to use this plugin. Usage examples: <pre>mv LOEUF.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin LOEUF,file=/path/to/loeuf/data.tsv.gz,match_by= gene ./vep -i variations.vcf --plugin LOEUF,file=/path/to/loeuf/data.tsv.gz,match_by= transcript</pre>			
LoFtool  Loss-of-function	Add LoFtool scores to Ensembl VEP output. LoFtool provides a rank of genic intolerance and consequent susceptibility to disease based on the ratio of Loss-of-function (LoF) to synonymous mutations for each gene in 60,706 individuals from ExAC, adjusting for the gene de novo mutation rate and evolutionary protein conservation. The lower the LoFtool gene score percentile the most intolerant is the gene to functional variation. For more details please see (Fadista J et al. 2017), PMID:27563026. The authors would like to thank the Exome Aggregation Consortium and the groups that provided exome variant data for comparison. A full list of contributing groups can be found at http://exac.broadinstitute.org/about. The LoFtool_scores.txt file is found alongside the plugin in the VEP_plugins GitHub repo. To use another scores file, add it as a parameter i.e. <pre>./vep -i variants.vcf --plugin LoFtool,scores_file.txt</pre> Usage examples: <pre>mv LoFtool.pm ~/.vep/Plugins mv LoFtool_scores.txt ~/.vep/Plugins ./vep -i variants.vcf --plugin LoFtool</pre>	Pathogenicity predictions	DBI 	Ensembl
LOVD  Leiden Open Variation Database	An Ensembl VEP plugin that retrieves LOVD variation data from http://www.lovd.nl/. Please be aware that LOVD is a public resource of curated variants, therefore please respect this resource and avoid intensive querying of their databases using this plugin, as it will impact the availability of this resource for others. Usage examples: <pre>mv LOVD.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin LOVD</pre>	Variant data	LWP::UserAgent 	Ensembl

Plugin	Description	Category	External libraries	Developer
Mastermind	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that uses the Mastermind Genomic Search Engine (https://www.genomenon.com/mastermind) to report variants that have clinical evidence cited in the medical literature. It is available for both GRCh37 and GRCh38. Please cite the Mastermind publication alongside Ensembl VEP if you use this resource: https://www.frontiersin.org/article/10.3389/fgene.2020.577152 Running options: The plugin has multiple parameters, the first one is expected to be the file name path which can be followed by 3 optional flags. Default: the plugin matches the citation data with the specific mutation. Using first flag 1: returns the citations for all mutations/transcripts. Using the second flag 1: only returns the Mastermind variant identifier(s). Using the third flag 1: also returns the Mastermind URL. Output: The output includes three unique counts 'MMCNT1, MMCNT2, MMCNT3' and one identifier MMID3 to be used to build an URL which shows all articles from MMCNT3. ● MMCNT1 is the count of Mastermind articles with cDNA matches for a specific variant; ● MMCNT2 is the count of Mastermind articles with variants either explicitly matching at the cDNA level or given only at protein level; ● MMCNT3 is the count of Mastermind articles including other DNA-level variants resulting in the same amino acid change; ● MMID3 is the Mastermind variant identifier(s), as gene:key. Link to the Genomenon Mastermind Genomic Search Engine; To build the URL, substitute the <code>gene:key</code> in the following link with the value from MMID3: https://mastermind.genomenon.com/detail?mutation=gene:key If the third flag is used then the built URL is returned and it's identified by URL. More information can be found at: https://www.genomenon.com/cvr/ The following steps are necessary before running this plugin: Download and Registry (free): https://www.genomenon.com/cvr/ GRCh37 VCF: <pre>unzip mastermind_cited_variants_reference-XXXX.XX.XX-grch37-vcf.zip bgzip mastermind_cited_variants_reference-XXXX.XX.XX-GRCh37-vcf tabix -p vcf mastermind_cited_variants_reference-XXXX.XX.XX-GRCh37-vcf.gz</pre> GRCh38 VCF: <pre>unzip mastermind_cited_variants_reference-XXXX.XX.XX-grch38-vcf.zip bgzip mastermind_cited_variants_reference-XXXX.XX.XX-GRCh38-vcf tabix -p vcf mastermind_cited_variants_reference-XXXX.XX.XX-GRCh38-vcf.gz</pre>	Phenotype data and citations	-	Ensembl

Plugin	Description	Category	External libraries	Developer
	The plugin can then be run as default: <pre>./vep -i variations.vcf --plugin Mastermind, file=/path/to/mastermind_cited_variants_reference-XXXX.XX.XX.GRChXX-vcf.gz</pre> or with an option to not filter by mutations (first flag): <pre>./vep -i variations.vcf --plugin Mastermind, file=/path/to/mastermind_cited_variants_reference-XXXX.XX.XX.GRChXX-vcf.gz, mutations=1</pre> or with an option to only return MMID3 e.g. the Mastermind variant identifier as gene:key (second flag): <pre>./vep -i variations.vcf --plugin Mastermind, file=/path/to/mastermind_cited_variants_reference-XXXX.XX.XX.GRChXX-vcf.gz, mutations=0, var_iden=1</pre> or with an option to also return the Mastermind URL (third flag): <pre>./vep -i variations.vcf --plugin Mastermind, file=/path/to/mastermind_cited_variants_reference-XXXX.XX.XX.GRChXX-vcf.gz, mutations=0, var_iden=0, url=1</pre> Note: when running in offline mode Mastermind requires a fasta file (--fasta) Usage examples: <pre>mv Mastermind.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin Mastermind, file=/path/to/data.vcf.gz ./vep -i variations.vcf --plugin Mastermind, file=/path/to/data.vcf.gz, mutations=1 ./vep -i variations.vcf --plugin Mastermind, file=/path/to/data.vcf.gz, mutations=0, var_iden=1 ./vep -i variations.vcf --plugin Mastermind, file=/path/to/data.vcf.gz, mutations=0, var_iden=0, url=1</pre>			
MaveDB	An Ensembl VEP plugin that retrieves data from MaveDB (https://www.mavedb.org), a database that contains multiplex assays of variant effect, including deep mutational scans and massively parallel report assays. To run the MaveDB plugin, please download the following files containing MaveDB data for GRCh38 (we do not currently host data for other assemblies): https://ftp.ensembl.org/pub/current_variation/MaveDB/MaveDB_variants.tsv.gz https://ftp.ensembl.org/pub/current_variation/MaveDB/MaveDB_variants.tsv.gz.thi	Functional effect	File::Basenome Bio::SeqUtils	Ensembl

Plugin	Description		Category	External libraries	Developer
	Argument	Description			
	file	(mandatory) Tabix-indexed MaveDB file			
	cols	Colon-separated columns to print from MaveDB files; if set to <code>all</code> , all columns are printed (default: <code>urn:score:nt:pro:doi</code>)			
	single_aminoacid_changes	Return matches for single aminoacid changes only; if disabled, return all matches associated with a genetic variant (default: 1)			
	transcript_match	Return results only if (Ensembl or RefSeq) transcript identifiers match (default: 1)			

Please cite the MaveDB publication alongside Ensembl VEP if you use this resource: <https://doi.org/10.1186/s13059-019-1845-6>

The tabix utility must be installed in your path to use this plugin.

Usage examples:

```

mv MaveDB.pm ~/.vep/Plugins

# print only scores for single aminoacid
changes from MaveDB data (default)
./vep -i variations.vcf --plugin
MaveDB,file=/full/path/to/data.csv.gz

# print all scores associated with the genetic
variant
./vep -i variations.vcf --plugin
MaveDB,file=/full/path/to/data.csv.gz,single_am
inoacid_changes=0

# print all columns from MaveDB data
./vep -i variations.vcf --plugin
MaveDB,file=/full/path/to/data.csv.gz,cols=all

```

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

the highest scoring k-mers containing the alternate allele. For all other variants, the comparison scores are derived from the highest scoring k-mers containing the reference allele. The difference between the reference comparison and alternate scores (SWA_REF_COMP - SWA_ALT) are also provided.

If NCSS is specified as a command-line argument, scores for the nearest upstream and downstream canonical splice sites are also included.

By default, only scores are reported. Add `verbose` to the list of command-line arguments to include the sequence output associated with those scores.

Usage examples:

```
mv MaxEntScan.pm ~/.vep/Plugins
./vep -i variants.vcf --plugin
MaxEntScan,/path/to/maxentscan/fordownload
./vep -i variants.vcf --plugin
MaxEntScan,/path/to/maxentscan/fordownload,SWA,
NCSS
```

MechPredic 	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that annotates missense variants with predicted dominant-negative (DN), gain-of-function (GOF), or loss-of-function (LOF) mechanisms derived from a Support Vector Classification (SVC) model (Badonyi et al., 2024). These probabilities do not predict a gene is involved in disease, they predict the most likely molecular mechanism by which deleterious variants in a given gene could cause disease, if it was a dominant disease gene. Note: • The plugin requires MechPredict_input.tsv, a pre-processed prediction dataset in TSV format. • The wrangled file should contain gene-level probabilities for the three mechanism categories. • The plugin adds the following fields to the VEP output: • MechPredict_pDN: Probability of a dominant-negative (DN) mechanism • MechPredict_pGOF: Probability of a gain-of-function (GOF) mechanism • MechPredict_pLOF: Probability of a loss-of-function (LOF) mechanism • MechPredict_prediction: Statement of the most likely mechanism based on empirically-derived cutoffs from Badonyi et al., 2024. Usage: 1. Download the Badonyi et al., 2024 raw data, available at the links below: • GOF: https://osf.io/h45ns • DN: https://osf.io/xfy38 • LOF: https://osf.io/dj4qg 2. The plugin input data can then be prepared from the raw data using: <code>`bash cut --complement -f4 pdn_svm_poly_2023-07-25.tsv </code>	Gene tolerance to change Data::Dumpe 	Ensembl
--	---	--	---------

Plugin	Description	Category	External libraries	Developer
	>plof_mod.tsv && join -t '\$\t' -1 1 -2 1 pdn_mod.tsv pgof_mod.tsv join -t '\$\t' -1 1 -2 1 - plof_mod.tsv cut --complement -f1,5,6,8,9 sed '1i gene uniprot_id pDN pGOF pLOF' >MechPredict_input.tsv && <pre>rm pdn_mod.tsv pgof_mod.tsv plof_mod.tsv</pre> 3. VEP can be run with the MechPredict plugin as follows: <code>`bash</code> <pre>./vep -i variations.vcf --plugin MechPredict,file=/path/to/mechpredict_data.tsv</pre> Citation: Badonyi M, Marsh JA (2024) Proteome-scale prediction of molecular mechanisms underlying dominant genetic diseases. PLoS ONE 19(8): e0307312. https://doi.org/10.1371/journal.pone.0307312 Usage examples: <pre>mv MechPredict.pm ~/.vep/Plugins ./vep -i input.vcf --plugin MechPredict,file=mechpredict_data.tsv</pre>			
MPC  missense deleteriousness metric	An Ensembl VEP plugin that retrieves MPC scores for variants from a tabix-indexed MPC data file. MPC is a missense deleteriousness metric based on the analysis of genic regions depleted of missense mutations in the Exome Aggregation Consortium (ExAC) data. The MPC score is the product of work by Kaitlin Samocha (ks20@sanger.ac.uk). Publication currently in pre-print: Samocha et al bioRxiv 2017 (TBD) The MPC score file is available to download from: ftp://ftp.broadinstitute.org/pub/ExAC_release/release1/regional_misense_constraint/ The data are currently mapped to GRCh37 only. Not all transcripts are included; see README in the above directory for exclusion criteria. Usage examples: <pre>mv MPC.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin MPC,fordist_constraint_official_mpc_values.txt.gz</pre>	Pathogenicity predictions	-	Ensembl
MTR  Missense Tolerance Ratio	An Ensembl VEP plugin that retrieves Missense Tolerance Ratio (MTR) scores for variants from a tabix-indexed flat file. MTR scores quantify the amount of purifying selection acting specifically on missense variants in a given window of protein-coding sequence. It is estimated across a sliding window of 31 codons and uses observed standing variation data from the WES component of the Exome Aggregation Consortium Database (ExAC), version 2.0 (http://gnomad.broadinstitute.org).	Pathogenicity predictions	-	- Slave Petrovski - Michael Silk
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
	The Bio::DB::HTS perl library or tabix utility must be installed in your path to use this plugin. MTR flat files can be downloaded from http://biosig.unimelb.edu.au/mtr-viewer/downloads The following steps are necessary before running the plugin <pre> gzip -d mtrflatfile_2.0.txt.gz # to unzip the text file cat mtrflatfile_2.0.txt tr " " "\t" > mtrflatfile_2.00.tsv # to change the file to a tabbed delimited file sed '1s/.*/#&/' mtrflatfile_2.00.tsv > mtrflatfile_2.0.tsv # to add # to the first line of the file bgzip mtrflatfile_2.0.tsv tabix -f -s 1 -b 2 -e 2 mtrflatfile_2.0.tsv.gz </pre> NB: Data are available for GRCh37 only Usage examples: <pre> mv MTR.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin MTR,mtrflatfile_2.0.tsv.gz </pre>			

[mutfunc](#) 

An Ensembl VEP plugin that retrieves data from mutfunc db predicting destabilization of protein structure, interaction interface, and motif.

Please cite the mutfunc publication alongside Ensembl VEP if you use this resource: <http://msb.embopress.org/content/14/12/e8430>

Pre-requisites:

1. The data file. mutfunc SQLite db can be downloaded from - https://ftp.ensembl.org/pub/current_variation/mutfunc/mutfunc_data.db
2. If you are using --offline please provide a FASTA file as this plugin requires the translation sequence to function.

Options are passed to the plugin as key=value pairs:

Argument	Description
db	(mandatory) Path to SQLite database containing data for other analysis.
motif	Select this option to have mutfunc motif analysis in the output
int	Select this option to have mutfunc protein interection analysis in the output
mod	Select this option to have mutfunc protein structure analysis in the output
exp	Select this option to have mutfunc protein structure (experimental) analysis in the output
extended	By default mutfunc outputs the most significant field for any analysis. Select this option to get more verbose output.

Protein
annotation

- [Digest::MD5](#)  qw(md5_hex)
- [DBI](#) 
- [List::MoreUtils](#)  qw(first_index)
- [Compress::Zlib](#) 

Ensembl

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

Usage examples:

```
mv mutfunc.pm ~/.vep/Plugins
./vep -i variations.vcf --plugin
mutfunc,motif=1,extended=1,db=/FULL_PATH_TO/mut
func_data.db
./vep -i variations.vcf --plugin
mutfunc,db=/FULL_PATH_TO/mutfunc_data.db
```

NearestExonJB	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that finds the nearest exon junction boundary to a coding sequence variant. More than one boundary may be reported if the boundaries are equidistant or if using option --intronic.	Nearby features	-	Ensembl
-------------------------------	--	----------------------------	---	---------

The plugin will report the Ensembl identifier of the exon, the distance to the exon boundary, the boundary type (start or end of exon) and the total length in nucleotides of the exon.

Various key=value parameters can be altered by passing them to the plugin command:

Argument	Description
max_range	maximum search range in bp (default: 10000)
intronic	set to 1 to check nearest exons for intronic variants (default: 0) returns the nearest exon upstream and downstream without considering the max_range.

Parameters are passed e.g.:

```
--plugin NearestExonJB,max_range=50000
--plugin
NearestExonJB,max_range=50000,intronic=1
--plugin NearestExonJB,intronic=1
```

Usage examples:

```
mv NearestExonJB.pm ~/.vep/Plugins
./vep -i variations.vcf --cache --plugin
NearestExonJB
```

NearestGene	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that finds the nearest gene(s) to a non-genic variant. More than one gene may be reported if the genes overlap the variant or if genes are equidistant or if option both_directions is used.	Nearby features	-	Ensembl
-----------------------------	---	----------------------------	---	---------

Various key=value parameters can be altered by passing them to the plugin command:

Argument	Description
limit	limit the number of genes returned (default: 1)
range	initial search range in bp (default: 1000)

Plugin	Description	Category	External libraries	Developer								
	<table><tr><th>Argument</th><th>Description</th></tr><tr><td>max_range</td><td>maximum search range in bp (default: 50000)</td></tr><tr><td>both_directions</td><td>return the nearest genes upstream and downstream of the variant this option overwrites the limit to 1 note that the max_range affects the search range in both directions</td></tr></table> Parameters are passed e.g.: <pre>--plugin NearestGene,limit=3,max_range=50000 --plugin NearestGene,max_range=50000,both_directions=1</pre> This plugin requires a database connection. It cannot be run in offline mode i.e. using the --offline flag. Usage examples: <pre>mv NearestGene.pm ~/.vep/Plugins ./vep -i variations.vcf --cache --plugin NearestGene</pre>	Argument	Description	max_range	maximum search range in bp (default: 50000)	both_directions	return the nearest genes upstream and downstream of the variant this option overwrites the limit to 1 note that the max_range affects the search range in both directions					
Argument	Description											
max_range	maximum search range in bp (default: 50000)											
both_directions	return the nearest genes upstream and downstream of the variant this option overwrites the limit to 1 note that the max_range affects the search range in both directions											
neXtProt	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that retrieves data for missense and stop gain variants from neXtProt, which is a comprehensive human-centric discovery platform that offers integration of and navigation through protein-related data for example, variant information, localization and interactions (https://www.nextprot.org/). Please cite the neXtProt publication alongside Ensembl VEP if you use this resource: https://doi.org/10.1093/nar/gkz995 This plugin is only suitable for small sets of variants as an additional individual remote API query is run for each variant. The neXtProt_headers.txt file is a requirement for running this plugin and is found alongside the plugin in the VEP_plugins GitHub repository. The file contains the RDF entities extracted from https://snorql.nextprot.org/ Running options: (Default) the data retrieved by default is the MatureProtein, NucleotidePhosphateBindingRegion, Variant, MiscellaneousRegion, TopologicalDomain and InteractingRegion. The plugin can also be run with other options to retrieve other data than the default. Options are passed to the plugin as key=value pairs: <table><tr><th>Argument</th><th>Description</th></tr><tr><td>max_set</td><td>Set value to 1 to return all available protein-related data (includes the default data)</td></tr><tr><td>return_value</td><td>The set of data to be returned with different data separated by &. Use file neXtProt_headers.txt to check which data (labels) are available. Example: --plugin neXtProt,return_values=Domain&InteractingRegion</td></tr><tr><td>url</td><td>Set value to 1 to include the URL to link to the neXtProt you are agreeing to this as outlined in our Privacy Policy and Terms of Use</td></tr></table>	Argument	Description	max_set	Set value to 1 to return all available protein-related data (includes the default data)	return_value	The set of data to be returned with different data separated by &. Use file neXtProt_headers.txt to check which data (labels) are available. Example: --plugin neXtProt,return_values=Domain&InteractingRegion	url	Set value to 1 to include the URL to link to the neXtProt you are agreeing to this as outlined in our Privacy Policy and Terms of Use	Protein data	JSON::XS	Ensembl

	ES...EE...I.ES...EE.I.ES...EE.I.ES...EE (ES= exon_start,EE = exon_end, I = intron, v = variant location) 2. The variant location falls 50 bases upstream of the penultimate (second to the last) exon. v v v ES...EE...I.ES...EE.I.ES...EE.I.ES...EE (ES= exon_start,EE = exon_end, I = intron, v = variant location) 3. The variant falls in the first 100 coding bases in the transcript. v v v ..ES...EE...I.ES...EE.I.ES...EE.I.ES...EE (ES= exon_start,EE = exon_end, I = intron, v = variant location) 4. If the variant is in an intronless transcript, meaning only one exon exist in the transcript. The additional term NMD-escaping variant (nonsense-mediated mRNA decay escaping variants) will be added if the variant matches any of the rules. REFERENCES : - Identifying Genes Whose Mutant Transcripts Cause Dominant Disease Traits by Potential Gain-of-Function Alleles (Coban-Akdemir, 2018) - The rules and impact of nonsense-mediated mRNA decay in human cancers (Lindeboom, 2016) Usage examples: mv NMD.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin NMD			
OpenTargets 	An Ensembl VEP plugin that integrates data from Open Targets Platform (https://platform.opentargets.org), a target identification tool that includes comprehensive variant annotation and the results of state-of-the-art large-scale statistical analyses, including fine-mapping, colocalisation, and locus-to-gene assignment across all complex and molecular traits. Data from Open Targets Platform includes two types of associations: GWAS based and QTL base. For GWAS studies, the data contains a locus-to-gene (L2G) scores to predict causal genes at GWAS loci. The tabix utility must be installed in your path to use this plugin. The Open Targets Genetics file and respective index (TBI) file can be downloaded from: https://ftp.ebi.ac.uk/pub/databases/opentargets/platform/latest/etc/export/vep_data/ Before using the plugin, split the Open Targets file in two: a file containing all GWAS associations (and corresponding tabix index file) (zcat open_targets_vep.tsv.bgz head -n 1 sed 's/.*##&'; zcat open_targets_vep.tsv.bgz awk -F \$'\t' '\$7 == "L2G"' zcat open_targets_gwas.tsv.bgz	Variant data	File::Basenome  Bio::SeqUtil 	Ensembl
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

```
tabix -s 1 -b 2 -e 2
open_targets_vep_gwas.tsv.bgz
```

2) a file containing all QTL associations (and corresponding tabix index file) (zcat open_targets_vep.tsv.bgz | head -n 1 | sed 's/.*/#&/' ; zcat open_targets_vep.tsv.bgz | awk -F \$'\t' '\$7 ~ /qtl\$/ ') | cut -d \$'\t' -f 1-16,20,21 | bgzip -c > open_targets_vep_qtl.tsv.bgz

```
tabix -s 1 -b 2 -e 2
open_targets_vep_qtl.tsv.bgz
```

To use the original file (with all associations), comment out the header line and regenerate the tabix-index to include the header.

```
zcat open_targets_vep.tsv.bgz | sed '1
s/.*/#&/' | bgzip -c >
open_targets_vep.tsv.bgz.tmp; mv
open_targets_vep.tsv.bgz.tmp
open_targets_vep.tsv.bgz
tabix -s 1 -b 2 -e 2
open_targets_vep.tsv.bgz
```

Options are passed to the plugin as key=value pairs:

Argument	Description
file	(mandatory) Tabix-indexed file from Open Targets platform. File should contain GWAS- or QTL- annotations, or both.
lead_variants_only	(optional) boolean to filter out non-lead variant associations, 1 (filtered) or 0 (unfiltered). (default: 1)
study_type	(optional) Study types to filter for. Can be all to include all, QTL to include all /*qtl/ types, or a colon-separated list of study types found in the file. (default: all)
cols	(optional) Colon-separated list of columns to return from the plugin file. (default: "gwasLocusToGeneScore:gwasGenelId:gwasDiseaseS" on GWAS annotations and "qtlGenelId:qtlBiosampleName" for QTL annotations); use all to print all data

Please cite the Open Targets Platform publication alongside Ensembl VEP if you use this resource:
<https://doi.org/10.1093/nar/gkae1128>

Usage examples:

```
mv OpenTargets.pm ~/.vep/Plugins

# print Open Targets Platform associations
# (both GWAS and QTL) and their respective
# identifiers (default)
./vep -i variations.vcf --plugin
OpenTargets --path/to/data.tsv --
```

Plugin	Description	Category	External libraries	Developer
	<pre># print all information for Open Targets Platform associations found ./vep -i variations.vcf --plugin OpenTargets, file=path/to/data.tsv.bz, cols=all # Only return Open Targets Platform associations found in the GWAS catalog ./vep -i variations.vcf --plugin OpenTargets, study_types=gwas, file=path/to/data. tsv.bz</pre>			

Paralogues

An Ensembl VEP plugin that fetches variants overlapping the genomic coordinates of amino acids aligned between paralogue proteins. This is useful to predict the pathogenicity of variants in paralogue positions.

This plugin can determine paralogue regions for a variant based on:

1. Pre-computed matches between genomic regions and paralogue variants. For this approach, either download the file calculated using ClinVar variants and respective TBI from https://ftp.ensembl.org/pub/current_variation/Paralogues or create such matches file yourself. Details on how to create such `matches` file can be found below.
2. Ensembl paralogue annotation. These versatile annotations can look up paralogue regions for all variants from any species with Ensembl paralogues, but take longer to process.

After retrieving the paralogue regions, this plugin fetches variants overlapping those regions from one of the following sources (by this order):

1. Custom VCF via the `vcf` parameter
2. Ensembl VEP cache (in cache/offline mode)
3. Ensembl API (in database mode)

To create a `matches` file based on a custom set of variants, run using `--plugin Paralogues,regions=1,min_perc_cov=0,min_perc_pos=0,clnsig=ignore` and the `--vcf` option. Afterwards, process the output of the command: ``perl -e "use Paralogues; Paralogues::prepare_matches_file(variant_effect_output.txt)"``

Options are passed to the plugin as key=value pairs:

Argument	Description
<code>matches</code>	Tabix-indexed TSV file with pre-computed matches between genomic regions and paralogue variants (fastest method); this option is incompatible with the <code>paralogues</code> and <code>vcf</code> options
<code>dir</code>	Directory with paralogue annotation (the annotation is created in this folder if the paralogue annotation files do not exist)
<code>paralogue</code>	Tabix-indexed TSV file with paralogue annotation (if the file does not exist, the annotation is automatically created); if set to <code>remote</code> , the annotation is fetched but not stored

Ensembl

Plugin	Description	Category	External libraries	Developer
	Argument vcf Tabix-indexed VCF file to fetch variant information (if not used, variants are fetched from Ensembl VEP cache in cache/offline mode or Ensembl API in database mode)			
	filter Colon-separated list of information from paralogue variants to output (default: identifier:alleles:clinical_significance); keyword all can be used to print all fields; available fields include identifier, chromosome, start, alleles, perc_cov, perc_pos, and clinical_significance (if clnsig_col is defined for custom VCF); additional fields are available depending on variant source: - Ensembl VEP cache: end and strand - Ensembl API: end, strand, source, consequence and gene_symbol - Custom VCF: quality, filter and name of INFO fields - Matches file: check column names in file header			
	clinical Clinical significance term to filter variants (default: pathogenic); use ignore to fetch all paralogue variants, regardless of clinical significance			
	clinical_match Type of match when filtering variants based on option clnsig: partial (default), exact or regex			
	clinical_col Column name containing clinical significance in custom VCF (required with vcf option and if clnsig is not ignore)			
	minimum_percov Minimum alignment percentage of the peptide associated with the input variant (default: 0)			
	minimum_perc_pos Minimum percentage of positivity (similarity) between both homologues (default: 50)			
	regions Boolean value to return regions used to look up paralogue variants (default: 1)			
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

The tabix utility must be installed in your path to read the paralogue annotation, the custom VCF file and the matches file.

Usage examples:

```
mv Paralogues.pm ~/.vep/Plugins

# Find paralogue regions of all input variants
using Ensembl paralogue annotation
# (automatically created if not in current
directory) and fetch variants within
# those regions from Ensembl VEP cache and
whose clinical significance partially
# matches 'pathogenic'
./vep -i variations.vcf --cache --plugin
Paralogues

# Find paralogue regions of input variants
using Ensembl paralogue annotation
# (automatically created if not in current
directory) and fetch variants within
# those regions from a custom VCF file
(regardless of their clinical significance)
./vep -i variations.vcf --cache --plugin
Paralogues,vcf=/path/to/file.vcf,clnsig=ignore

# Same using a custom VCF file but filtering
for 'pathogenic' variants
./vep -i variations.vcf --cache --plugin
Paralogues,vcf=/path/to/file.vcf,clnsig_col=CLN
SIG

# Same but output different fields
./vep -i variations.vcf --cache --plugin
Paralogues,vcf=/path/to/file.vcf.gz,clnsig_col=
CLNSIG,fields=identifier:alleles:CLNSIG:CLNVI:G
ENEINFO

# Use a file with regions matched to paralogue
variants -- fastest method;
# download 'matches' files from
https://ftp.ensembl.org/pub/current_variation/P
aralogues
./vep -i variations.vcf --cache --plugin
Paralogues,matches=Paralogues.pm_homo_sapiens_1
13_GRCh38_clinvar_20240107.tsv.gz,clnsig=ignore

# Same using a 'matches' file but filtering for
'pathogenic' variants (default)
./vep -i variations.vcf --cache --plugin
Paralogues,matches=Paralogues.pm_homo_sapiens_1
13_GRCh38_clinvar_20240107.tsv.gz

# Fetch all Ensembl variants in paralogue
proteins using only the Ensembl API
# (requires database access)
./vep -i variations.vcf --database --plugin
Paralogues,mode=remote,clnsig=ignore
```

PhenotypeOrthologous An Ensembl VEP plugin that retrieves phenotype information associated with orthologous genes from model organisms.	Phenotype data and citations	-	Ensembl
---	---	---	---------

Plugin	Description	Category	External libraries	Developer
	The plugin can be run: <pre>./vep -i variations.vcf --plugin PhenotypeOrthologous, file=PhenotypesOrthologous_homo_sapiens_112_GRCh38.gff3.gz</pre> The file option is mandatory to run this plugin To return only results for rat : <pre>./vep -i variations.vcf --plugin PhenotypeOrthologous, file=PhenotypesOrthologous_homo_sapiens_112_GRCh38.gff3.gz, model=rat</pre> To return only results for mouse: <pre>./vep -i variations.vcf --plugin PhenotypeOrthologous, file=PhenotypesOrthologous_homo_sapiens_112_GRCh38.gff3.gz, model=mouse</pre> The tabix utility must be installed in your path to use this plugin. Check https://github.com/samtools/htslib.git for instructions. Usage examples: <pre>mv PhenotypeOrthologous.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin PhenotypeOrthologous, file=PhenotypesOrthologous_homo_sapiens_112_GRCh38.gff3.gz</pre>			

Phenotypes

An Ensembl VEP plugin that retrieves overlapping phenotype information.

On the first run for each new version/species/assembly will download a GFF-format dump to ~/.vep/Plugins/

Ensembl provides phenotype annotations mapped to a number of genomic feature types, including genes, variants and QTLs.

This plugin is best used with JSON output format; the output will be more verbose and include all available phenotype annotation data and metadata.

For other output formats, only a concatenated list of phenotype description strings is returned.

Several paramters can be set using a key=value system:

Argument	Description
dir	Path to directory where to look for phenotypes annotation. If the required file does not exist, the file is downloaded and saved in the provided directory (download requires using database or cache mode).
file	File path to phenotypes annotation. If the file does not exist, the file is downloaded and saved with this name (download requires using database or cache mode).

Phenotype data and citations

-

Ensembl

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

See

http://www.ensembl.org/info/genome/variation/phenotype/sources_phenotype_documentation.html

include_sources: &-separated list of phenotype sources to include. If defined, exclude_sources is ignored.

exclude_types : &-separated list of feature types to exclude: Gene, Variation, QTL, StructuralVariation, SupportingStructuralVariation, RegulatoryFeature. By default, StructuralVariation and SupportingStructuralVariation annotations are always excluded (due to size issues) and Variation is excluded when annotating structural variants; to get these annotations in all cases, use include_types=StructuralVariation&SupportingStructuralVariation&Variation

include_types : &-separated list of feature types to include. If defined, exclude_types is ignored.

expand_right : Cache size in bp. By default, annotations 100000bp (100kb) downstream of the initial lookup are cached.

phenotype_feature : Boolean to report the gene/variation associated with the phenotype (such as overlapping gene or structural

```
variation) and annotation
source (default: 0)
```

cols : &-separated list of column and/or attribute names to output from the gff file. The output fields will be ordered in the same way given in cols argument. (default: phenotype or source, phenotype, id if you set phenotype_feature=1)

id_match : Return results only if the identifiers matches with the

```
variant or the gene depending
on the type (default: 0)
```

Example:

```
--plugin
Phenotypes, file=${HOME}/phenotypes.gff.gz, include_types=Gene
--plugin
Phenotypes, dir=${HOME}, include_types=Gene
```

Usage examples:

```
mv Phenotypes.pm ~/.vep/Plugins

# Automatically download phenotype annotation
# files if needed and annotate
# variants with phenotypes
./vep -i variations.vcf --plugin Phenotypes

# Fetch only gene-associated phenotypes
./vep -i variations.vcf --plugin
Phenotypes, include_types=Gene

# Set directory with phenotypes annotations
# (phenotype annotation file is
# automatically downloaded if not available in
# this directory)
./vep -i variations.vcf --plugin
Phenotypes, dir=${HOME}, include_types=Gene
```

Plugin	Description	Category	External libraries	Developer
	<pre># Specify a file with phenotypes annotation (file is automatically # downloaded and saved with this name if it does not exist) ./vep -i variations.vcf --plugin Phenotypes,file=\${HOME}/phenotypes.gff.gz,inclu de_types=Gene</pre>			
pLI	An Ensembl VEP plugin that adds the probability of a gene being loss-of-function intolerant (pLI) to the output. Lek et al. (2016) estimated pLI using the expectation-maximization (EM) algorithm and data from 60,706 individuals from ExAC (http://exac.broadinstitute.org). The closer pLI is to 1, the more likely the gene is loss-of-function (LoF) intolerant. Note: the pLI was calculated using a representative transcript and is reported by gene in the plugin. The data for the plugin is provided by Kaitlin Samocha and Daniel MacArthur. See https://www.ncbi.nlm.nih.gov/pubmed/27535533 for a description of the dataset and analysis. The pLI_values.txt file is found alongside the plugin in the VEP_plugins GitHub repository. The file contains the fields gene and pLI extracted from the file at ftp://ftp.broadinstitute.org/pub/ExAC_release/release0.3/functional_gene_constraint/fordist_cleaned_exac_r03_march16_z_pli_rec_null_data.txt From this file, extract gene or transcript pLI scores: To extract gene scores : <pre>awk '{print \$2, \$20 }' fordist_cleaned_exac_r03_march16_z_pli_rec_null _data.txt > pLI_gene.txt</pre> NB: The gene scores file can also be found in the VEP_plugins directory. To extract transcript scores: <pre>awk '{print \$1, \$20 }' fordist_cleaned_exac_r03_march16_z_pli_rec_null _data.txt > pLI_transcript.txt</pre> NB: Using this file, No transcript score will be returned. To use another values file, add it as a parameter i.e. <pre>./vep -i variants.vcf --plugin pLI,values_file.txt ./vep -i variants.vcf --plugin pLI,values_file.txt,transcript # to check for the transcript score.</pre> gnomAD v4 release expanded the scale of pLI score calculation. The file can be downloaded from - https://gnomad.broadinstitute.org/downloads#v4-constraint (Constraint metrics TSV) To use the data you can follow the same procedure as above but needs to change the column number to accordingly	Gene tolerance to change	List::MoreUtils qw/zip/ DBI	Ensembl

Plugin	Description	Category	External libraries	Developer
	<pre>mv pLI.pm ~/.vep/Plugins mv pLI_values.txt ~/.vep/Plugins ./vep -i variants.vcf --plugin pLI</pre>			
PolyPhen_SIFT	An Ensembl VEP plugin that retrieves PolyPhen and SIFT predictions from a locally constructed SQLite database. It can be used when your main source of transcript annotation (e.g. a GFF file or GFF-based cache) does not contain these predictions. You must create a SQLite database of the predictions or point to the SQLite database file already created. Compatible SQLite databases based on pangenome data are available at http://ftp.ensembl.org/pub/current_variation/pangenomes You may point to the file by adding parameter <code>db=[file]</code>. If the file is not in <code>HOME/.vep</code>, you can also use parameter <code>dir=[dir]</code> to indicate its path. <pre>--plugin PolyPhen_SIFT,db=[file] --plugin PolyPhen_SIFT,db=[file],dir=[dir]</pre> To create a SQLite database using PolyPhen/SIFT data from the Ensembl database, you must have an active database connection (i.e. not using <code>--offline</code>) and add parameter <code>create_db=1</code>. This will create a SQLite file named <code>[species].PolyPhen_SIFT.db</code>, placed in the directory specified by the <code>dir</code> parameter: <pre>--plugin PolyPhen_SIFT,create_db=1 --plugin PolyPhen_SIFT,create_db=1,dir=/some/specific/directory</pre> *** NB: this will take some hours! *** When creating a PolyPhen_SIFT by simply using <code>create_db=1</code>, you do not need to specify any parameters to load the appropriate file based on the species: <pre>--plugin PolyPhen_SIFT</pre> By default, this plugin gives SIFT score and prediction, Polyphen humvar and humdiv score and prediction. You can manipulate what you want using the following options - sift [p s b o] provides SIFT prediction term, score, or both if the value is respectively p, s, or b. If the value is o then do not provide SIFT prediction or score. Default value is b. polyphen [p s b o] provides PolyPhen humvar prediction term, score, or both if the value is respectively p, s, or b. If the value is o then do not provide PolyPhen humvar prediction or score. Default value is b. humdiv [p s b o] provides PolyPhen humdiv prediction term, score, or both if the value is respectively p, s, or b. If the value is o then do not provide PolyPhen humdiv prediction or score. Default value is b.	Pathogenicity predictions ● Digest::MD5 qw(md5_hex) ● DBI	Ensembl	

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Usage examples:

Plugin	Description	Category	External libraries	Developer				
	<pre>mv PolyPhen_SIFT.pm ~/.vep/Plugins # Read default PolyPhen/SIFT SQLite file in \$HOME/.vep ./vep -i variations.vcf -cache --plugin PolyPhen_SIFT # Read database with custom name and/or located in a custom directory ./vep -i variations.vcf -cache --plugin PolyPhen_SIFT,db=custom.db ./vep -i variations.vcf -cache --plugin PolyPhen_SIFT,dir=/some/custom/dir ./vep -i variations.vcf -cache --plugin PolyPhen_SIFT,db=custom.db,dir=/some/custom/dir # Create PolyPhen/SIFT SQLite file based on Ensembl database ./vep -i variations.vcf -cache --plugin PolyPhen_SIFT,create_db=1 # Only get SIFT prediction and score ./vep -i variations.vcf -cache --plugin PolyPhen_SIFT,db=custom.db,polyphen=o,humdiv=o</pre>							
PON P2	This plugin for Ensembl Variant Effect Predictor (VEP) computes the predictions of PON-P2 for amino acid substitutions in human proteins. PON-P2 is developed and maintained by Protein Structure and Bioinformatics Group at Lund University and is available at http://structure.bmc.lu.se/PON-P2/. If you use this data, please cite the following publication Niroula, A., Vihinen, M. Harmful somatic amino acid substitutions affect key pathways in cancers. BMC Med Genomics 8, 53 (2015). https://doi.org/10.1186/s12920-015-0125-x There are two ways to run the plugin: 1. To compute the predictions from the PON-P2 API, use python script <code>ponp2.py (*)</code> and select the reference genome (acceptable values are: hg37 and hg38): <pre>--plugin PON_P2,pyscript=/path/to/python/script/ponp2 .py,hg=hg37</pre> (*) To run this mode, you will require a python script and its dependencies (Python, python suds). The python file can be downloaded from http://structure.bmc.lu.se/PON-P2/vep.html/ and the complete path to this file must be supplied while using this plugin. 2. To fetch the predictions from a file containing pre-calculated predictions for somatic variations please use the following key=value option (only available for GRCh37): <table><thead><tr><th>Argument</th><th>Description</th></tr></thead><tbody><tr><td>file</td><td>COSMIC text file with pre-calculated predictions downloaded from http://structure.bmc.lu.se/PON-P2/</td></tr></tbody></table>	Argument	Description	file	COSMIC text file with pre-calculated predictions downloaded from http://structure.bmc.lu.se/PON-P2/	Pathogenicity predictions	-	● Abhishek Niroula ● Mauno Vihinen
Argument	Description							
file	COSMIC text file with pre-calculated predictions downloaded from http://structure.bmc.lu.se/PON-P2/

Plugin	Description	Category	External libraries	Developer
	The following steps are necessary before using the file: <pre>(head -n 1 COSMIC.txt && tail -n +2 COSMIC.txt sort -t \$'\t' -k1,1 -k2,2n) > cosmic_sorted.txt sed -i 's/Chromosome/#Chromosome/' cosmic_sorted.txt bgzip cosmic_sorted.txt tabix -s 1 -b 2 -e 2 cosmic_sorted.txt.gz</pre> <pre>--plugin PON_P2, file=path/to/cosmic_sorted.txt.gz</pre> Usage examples: <pre>mv PON_P2.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin PON_P2, pyscript=/path/to/python/script/ponp2.py ,hg=hg37</pre>			

PostGAP

A VEP plugin that retrieves data for variants from a tabix-indexed PostGAP file (1-based file).

Phenotype
data and
citations

Ensembl

Please refer to the PostGAP github and wiki for more information:

<https://github.com/Ensembl/postgap>

<https://github.com/Ensembl/postgap/wiki>

<https://github.com/Ensembl/postgap/wiki/algorithm-pseudo-code>

The Bio::DB::HTS perl library or tabix utility must be installed in your path to use this plugin. The PostGAP data file can be downloaded from <https://storage.googleapis.com/postgap-data>.

The file must be processed and indexed by tabix before use by this plugin. PostGAP has coordinates for both GRCh38 and GRCh37; the file must be processed differently according to the assembly you use.

```
wget https://storage.googleapis.com/postgap-
data/postgap.txt.gz
gunzip postgap.txt.gz
```

GRCh38

```
(grep "^ld_snp_rsID" postgap.txt; grep -v
"^ld_snp_rsID" postgap.txt | sort -k4,4 -k5,5n
) | bgzip > postgap_GRCh38.txt.gz
tabix -s 4 -b 5 -e 5 -c 1 postgap_GRCh38.txt.gz
```

GRCh37

```
(grep "^ld_snp_rsID" postgap.txt; grep -v
"^ld_snp_rsID" postgap.txt | sort -k2,2 -k3,3n
) | bgzip > postgap_GRCh37.txt.gz
tabix -s 2 -b 3 -e 3 -c 1 postgap_GRCh37.txt.gz
```

Note that in the last command we tell tabix that the header line starts with "|"; this may change to the default of "#" in future versions of PostGAP.

Plugin	Description	Category	External libraries	Developer
	<pre>--plugin POSTGAP,/path/to/PostGap.gz</pre> You may include all columns with ALL; this fetches a large amount of data per variant!: <pre>--plugin POSTGAP,/path/to/PostGap.gz,ALL</pre> You may want to select only a specific subset of additional information to be reported, you can do this by specifying the columns as parameters to the plugin e.g. <pre>--plugin POSTGAP,/path/to/PostGap.gz,gwas_pmid,gwas_size</pre> If a requested column is not found, the error message will report the complete list of available columns in the POSTGAP file. For a brief description of the available information please refer to the 'How do I use POSTGAP output?' section in the POSTGAP wiki. Tabix also allows the data file to be hosted on a remote server. This plugin is fully compatible with such a setup - simply use the URL of the remote file: <pre>--plugin PostGAP,http://my.files.com/postgap.txt.gz</pre> Note that gene sequences referred to in PostGAP may be out of sync with those in the latest release of Ensembl; this may lead to discrepancies with scores retrieved from other sources. Usage examples: <pre>mv PostGAP.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin PostGAP,/path/to/PostGap.gz,col1,col2</pre>			
PrimateAI 	The PrimateAI plugin is designed to retrieve clinical impact scores of variants, as described in https://www.nature.com/articles/s41588-018-0167-z. Please consider citing the paper if using this plugin. In brief, common missense mutations in non-human primate species are usually benign in humans. Thousands of common variants from six non-human primate species were used to train a deep neural network to identify pathogenic mutations in humans with a rare disease. This plugin uses files generated by the PrimateAI software, which is available from https://github.com/Illumina/PrimateAI. The files containing predicted pathogenicity scores can be downloaded from https://basespace.illumina.com/s/yYGFdGih1rXL (a free BaseSpace account may be required): PrimateAI_scores_v0.2.tsv.gz (for GRCh37/hg19) PrimateAI_scores_v0.2_hg38.tsv.gz (for GRCh38/hg38) Before running the plugin for the first time, the following steps must be taken to format the downloaded files: 1. Unzip the score files 2. Add '#' in front of the column description line 3. Remove any empty lines. 4. Sort the file by chromosome and position 5. Compress the file in bgz format	Pathogenicity predictions	-	Ensembl

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

6. Create tabix index (requires tabix to be installed).

Command line examples for formatting input files:

```
gunzip -cf PrimateAI_scores_v0.2.tsv.gz | sed
'12s/.*/#&/' | sed '/^$/d' | awk 'NR<12{print
$0;next}{print $0 | "sort -k1,1 -k 2,2n -V"}' |
bgzip >
PrimateAI_scores_v0.2_GRCh37_sorted.tsv.bgz
tabix -s 1 -b 2 -e 2
PrimateAI_scores_v0.2_GRCh37_sorted.tsv.bgz
```

```
gunzip -cf PrimateAI_scores_v0.2_hg38.tsv.gz |
sed '12s/.*/#&/' | sed '/^$/d' | awk
'NR<12{print $0;next}{print $0 | "sort -k1,1 -k
2,2n -V"}' | bgzip >
PrimateAI_scores_v0.2_GRCh38_sorted.tsv.bgz
tabix -s 1 -b 2 -e 2
PrimateAI_scores_v0.2_GRCh38_sorted.tsv.bgz
```

Usage examples:

```
mv PrimateAI.pm ~/.vep/Plugins

./vep -i variations.vcf --plugin
PrimateAI,PrimateAI_scores_v0.2_GRCh37_sorted.t
sv.bgz
./vep -i variations.vcf --plugin
PrimateAI,PrimateAI_scores_v0.2_GRCh38_sorted.t
sv.bgz
```

[ProteinSeqs](#)
s

This is a plugin for the Ensembl Variant Effect Predictor (VEP) that prints out the reference and mutated protein sequences of any proteins found with non-synonymous mutations in the input file.

You should supply the name of file where you want to store the reference protein sequences as the first argument, and a file to store the mutated sequences as the second argument.

Note that, for simplicity, where stop codons are gained the plugin simply substitutes a "*" into the sequence and does not truncate the protein. Where a stop codon is lost any new amino acids encoded by the mutation are appended to the sequence, but the plugin does not attempt to translate until the next downstream stop codon. Also, the protein sequence resulting from each mutation is printed separately, no attempt is made to apply multiple mutations to the same protein.

Usage examples:

```
mv ProteinSeqs.pm ~/.vep/Plugins
./vep -i variations.vcf --plugin
ProteinSeqs,reference.fa,mutated.fa
./vep -i variations.vcf --plugin
ProteinSeqs,reference=reference.fa,mutated=muta
ted.fa
```

Sequence

-

Ensembl

[ProtVar](#)

An Ensembl VEP plugin that retrieves data from ProtVar resource providing contextualised information for missense variation, including destabilisation of protein structures, overlapping protein pockets, and protein-protein interaction interfaces. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Plugin	Description	Category	External libraries	Developer										
	Please cite the ProtVar publication alongside Ensembl VEP if you use this resource: https://academic.oup.com/nar/article/52/W1/W140/7676839 Pre-requisites: 1. The data file. ProtVar SQLite db can be downloaded from - https://ftp.ensembl.org/pub/current_variation/ProtVar/ProtVar_data.db 2. If you are using --offline please provide a FASTA file as this plugin requires the translation sequence to function. Options are passed to the plugin as key=value pairs:		● DBI ● List::MoreUtils ● Compress::Zlib											
	<table><tr><th>Argument</th><th>Description</th></tr><tr><td>db</td><td>(mandatory) Path to SQLite database containing the data.</td></tr><tr><td>stability</td><td>Select this option to have protein stability related output. Output contains - ddG - Free energy change upon mutation (in kcal/mol units). ddG > 2: likely to be destabilising.</td></tr><tr><td>pocket</td><td>Select this option to have overlapping protein pocket related output. Output contains - id - Pocket id; score - Combined score measuring confidence in pocket. score < 800: low confidence score 800-900: high confidence score > 900: very high confidence MpLDDT - Mean pLDDT score of all the residues from AlphaFold2 model used to form the pocket energy - Pocket energy per volume (in kcal/mol units) buriedness - Pocket buriedness (0.0 means entirely exposed and 1.0 means entirely buried) RoG - Pocket compactness in terms of radius of gyration (in Angstrom units) residues - Position of residues that form the pocket according to UniProt canonical (and AlphaFold) numbering.</td></tr><tr><td>interface</td><td>Select this option to have protein-protein interface related output. Output contains - protein - Uniprot id of the protein with which the overlapping protein creates an interface pDockQ - A docking score for the interface. score < 0.23: low confidence score 0.23-0.5: high confidence score > 0.5: very high confidence</td></tr></table> By default all of the three type of outputs (stability, pocket, int) are provided. But if you want to have some selected type and not all of them just select the relevant options. Usage examples: <pre>mv ProtVar.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin ProtVar,db=/FULL_PATH_TO/ProtVar.db ./vep -i variations.vcf --plugin ProtVar,db=/FULL_PATH_TO/ProtVar_data.db,stability=1</pre>	Argument	Description	db	(mandatory) Path to SQLite database containing the data.	stability	Select this option to have protein stability related output. Output contains - ddG - Free energy change upon mutation (in kcal/mol units). ddG > 2: likely to be destabilising.	pocket	Select this option to have overlapping protein pocket related output. Output contains - id - Pocket id; score - Combined score measuring confidence in pocket. score < 800: low confidence score 800-900: high confidence score > 900: very high confidence MpLDDT - Mean pLDDT score of all the residues from AlphaFold2 model used to form the pocket energy - Pocket energy per volume (in kcal/mol units) buriedness - Pocket buriedness (0.0 means entirely exposed and 1.0 means entirely buried) RoG - Pocket compactness in terms of radius of gyration (in Angstrom units) residues - Position of residues that form the pocket according to UniProt canonical (and AlphaFold) numbering.	interface	Select this option to have protein-protein interface related output. Output contains - protein - Uniprot id of the protein with which the overlapping protein creates an interface pDockQ - A docking score for the interface. score < 0.23: low confidence score 0.23-0.5: high confidence score > 0.5: very high confidence			
Argument	Description													
db	(mandatory) Path to SQLite database containing the data.													
stability	Select this option to have protein stability related output. Output contains - ddG - Free energy change upon mutation (in kcal/mol units). ddG > 2: likely to be destabilising.													
pocket	Select this option to have overlapping protein pocket related output. Output contains - id - Pocket id; score - Combined score measuring confidence in pocket. score < 800: low confidence score 800-900: high confidence score > 900: very high confidence MpLDDT - Mean pLDDT score of all the residues from AlphaFold2 model used to form the pocket energy - Pocket energy per volume (in kcal/mol units) buriedness - Pocket buriedness (0.0 means entirely exposed and 1.0 means entirely buried) RoG - Pocket compactness in terms of radius of gyration (in Angstrom units) residues - Position of residues that form the pocket according to UniProt canonical (and AlphaFold) numbering.													
interface	Select this option to have protein-protein interface related output. Output contains - protein - Uniprot id of the protein with which the overlapping protein creates an interface pDockQ - A docking score for the interface. score < 0.23: low confidence score 0.23-0.5: high confidence score > 0.5: very high confidence

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

the location of your variants. More information can be found at:
<https://www.ncbi.nlm.nih.gov/grc/human/issues>

The following steps are necessary before running this plugin:

GRCh38:

```
wget
https://ftp.ncbi.nlm.nih.gov/pub/grc/human/GRC/
GRCh38/MISC/annotated_clone_assembly_problems_G
CF_000001405.38.gff3
wget
https://ftp.ncbi.nlm.nih.gov/pub/grc/human/GRC/
Issue_Mapping/GRCh38.p12_issues.gff3
cat
annotated_clone_assembly_problems_GCF_000001405
.38.gff3 GRCh38.p12_issues.gff3 >
GRCh38_quality_mergedfile.gff3
sort -k 1,1 -k 4,4n -k 5,5n
GRCh38_quality_mergedfile.gff3 >
sorted_GRCh38_quality_mergedfile.gff3
bgzip sorted_GRCh38_quality_mergedfile.gff3
tabix -p gff
sorted_GRCh38_quality_mergedfile.gff3.gz
```

The plugin can then be run with:

```
./vep -i variations.vcf --plugin
ReferenceQuality,sorted_GRCh38_quality_mergedfi
le.gff3.gz
```

GRCh37:

```
wget
https://ftp.ncbi.nlm.nih.gov/pub/grc/human/GRC/
GRCh37/MISC/annotated_clone_assembly_problems_G
CF_000001405.25.gff3
wget
https://ftp.ncbi.nlm.nih.gov/pub/grc/human/GRC/
Issue_Mapping/GRCh37.p13_issues.gff3
cat
annotated_clone_assembly_problems_GCF_000001405
.25.gff3 GRCh37.p13_issues.gff3 >
GRCh37_quality_mergedfile.gff3
sort -k 1,1 -k 4,4n -k 5,5n
GRCh37_quality_mergedfile.gff3 >
sorted_GRCh37_quality_mergedfile.gff3
bgzip sorted_GRCh37_quality_mergedfile.gff3
tabix -p gff
sorted_GRCh37_quality_mergedfile.gff3.gz
```

The plugin can then be run with:

```
./vep -i variations.vcf --plugin
ReferenceQuality,sorted_GRCh37_quality_mergedfi
le.gff3.gz
```

The tabix utility must be installed in your path to use this plugin.

Usage examples:

Plugin	Description	Category	External libraries	Developer
	ReferenceQuality, /path/to/data.gff3.gz			
REVEL 	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that adds the REVEL score for missense variants to the output. Please cite the REVEL publication alongside Ensembl VEP if you use this resource: https://www.ncbi.nlm.nih.gov/pubmed/27666373 Running options: If available, the plugin will match the scores by transcript id (default). Using the flag 1 the plugin will not try to match by transcript id. REVEL scores can be downloaded from: https://sites.google.com/site/revelgenomics/downloads The plugin supports several REVEL file versions: ● REVEL file version Dec 2017, which has 7 columns and only GRCh37 coordinates ● REVEL file version Feb 2020, which has 8 columns with GRCh37 and GRCh38 coordinates ● REVEL file version May 2021, which has 9 columns with GRCh37 and GRCh38 coordinates and a new column with transcript ids These files can be tabix-processed by: <pre>unzip revel-v1.3_all_chromosomes.zip cat revel_with_transcript_ids tr "," "\t" > tabbed_revel.tsv sed '1s/.*/#&/' tabbed_revel.tsv > new_tabbed_revel.tsv bgzip new_tabbed_revel.tsv</pre> for GRCh37: <pre>tabix -f -s 1 -b 2 -e 2 new_tabbed_revel.tsv.gz</pre> for GRCh38: <pre>zcat new_tabbed_revel.tsv.gz head -n1 > h zgrep -h -v ^#chr new_tabbed_revel.tsv.gz awk '\$3 != "." ' sort -k1,1 -k3,3n - cat h - bgzip -c > new_tabbed_revel_grch38.tsv.gz tabix -f -s 1 -b 3 -e 3 new_tabbed_revel_grch38.tsv.gz</pre> The plugin can then be run as default: <pre>./vep -i variations.vcf --assembly GRCh38 -- plugin REVEL, file=/path/to/revel/data.tsv.gz</pre> or with the option to not match by transcript id: <pre>./vep -i variations.vcf --assembly GRCh38 -- plugin REVEL, file=/path/to/revel/data.tsv.gz, no_match= 1</pre>	Pathogenicity predictions	-	Ensembl

Requirements: The tabix utility must be installed in your path to use this plugin. The --assembly flag is required to use this plugin.

Usage examples:
 you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Plugin	Description	Category	External libraries	Developer
	<pre>mv REVEL.pm ~/.vep/Plugins ./vep -i variations.vcf --assembly GRCh37 --plugin REVEL,file=/path/to/revel/data.tsv.gz ./vep -i variations.vcf --assembly GRCh38 --plugin REVEL,file=/path/to/revel/data.tsv.gz</pre>			
RiboseqORF s	An Ensembl VEP plugin that uses a standardized catalog of human Ribo-seq ORFs to re-calculate consequences for variants located in these translated regions. This plugin reports new consequences based on the evidence from the Ribo-seq ORF annotation and supporting publications. The human Ribo-seq ORF data can be downloaded from: https://ftp.ebi.ac.uk/pub/databases/gencode/riboseq_orfs/data After downloading the annotation, please bgzip and tabix it: <pre>bgzip Ribo-seq_ORFs.bed tabix Ribo-seq_ORFs.bed.gz</pre> For optimal performance when running this plugin, please use a FASTA file (<code>--fasta</code>). A FASTA file is always required in offline mode. Please cite the publication for the Ribo-seq ORF annotation alongside Ensembl VEP if you use this resource: https://doi.org/10.1038/s41587-022-01369-0 The tabix utility must be installed in your path to use this plugin. Usage examples: <pre>./vep -i variations.vcf --plugin RiboseqORFs,file=/path/to/Ribo-seq_ORFs.bed.gz</pre>	Transcript annotation	-	Ensembl
SameCodon n	An Ensembl VEP plugin that reports existing variants that fall in the same codon. This plugin requires a database connection, can not be run in offline mode Usage examples: <pre>mv SameCodon.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin SameCodon</pre>	Variant data	-	Ensembl
satMutMPR A	An Ensembl VEP plugin that retrieves data for variants from a tabix-indexed satMutMPRA file (1-based file). The saturation mutagenesis-based massively parallel reporter assays (satMutMPRA) measures variant effects on gene RNA expression for 21 regulatory elements (11 enhancers, 10 promoters). The 20 disease-associated regulatory elements and one ultraconserved enhancer analysed in different cell lines are the following: - ten promoters (of TERT, LDLR, HBB, HBG, HNF4A, MSMB, PKLR, F9, FOXE1 and GP1BB) and - ten enhancers (of SORT1, ZRS, BCL11A, IRF4, IRF6, MYC (2x), RET, TCF7L2 and ZFAND3) and	Phenotype data and citations	-	Ensembl
This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our Privacy Policy and Terms of Use				

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

Please refer to the satMutMPRA web server and Kircher M et al. (2019) paper for more information:
<https://mpira.gs.washington.edu/satMutMPRA/>
<https://www.ncbi.nlm.nih.gov/pubmed/31395865>

Parameters can be set using a key=value system:

Argument	Description
file	required - a tabix indexed file of the satMutMPRA data corresponding to desired assembly.
pvalue	p-value threshold (default: 0.00001)
cols	colon delimited list of data types to be returned from the satMutMPRA data (default: Value, P-Value, and Element)
include_replicates	include replicates (default: off): - full replicate for LDLR promoter (LDLR.2) and SORT1 enhancer (SORT1.2) - a reversed sequence orientation for SORT1 (SORT1-flip) - other conditions: PKLR-48h, ZRSh-13h2, TERT-GAa, TERT-GBM, TERG-GSc

The Bio::DB::HTS perl library or tabix utility must be installed in your path to use this plugin. The satMutMPRA data file can be downloaded from <https://mpira.gs.washington.edu/satMutMPRA/>

satMutMPRA data can be downloaded for both GRCh38 and GRCh37 from the web server (<https://mpira.gs.washington.edu/satMutMPRA/>): Download section, select GRCh37 or GRCh38 for 'Genome release' and 'Download All Elements'.

The file must be processed and indexed by tabix before use by this plugin.

GRCh38

```
(grep ^Chr GRCh38_ALL.tsv; grep -v ^Chr
GRCh38_ALL.tsv | sort -k1,1 -k2,2n ) | bgzip >
satMutMPRA_GRCh38_ALL.gz
tabix -s 1 -b 2 -e 2 -c C
satMutMPRA_GRCh38_ALL.gz
```

GRCh37

```
(grep ^Chr GRCh37_ALL.tsv; grep -v ^Chr
GRCh37_ALL.tsv | sort -k1,1 -k2,2n ) | bgzip >
satMutMPRA_GRCh37_ALL.gz
tabix -s 1 -b 2 -e 2 -c C
satMutMPRA_GRCh37_ALL.gz
```

When running the plugin by default Value, P-Value, and Element information is returned e.g.

Plugin	Description	Category	External libraries	Developer
	You may include all columns with ALL; this fetches all data per variant (e.g. Tags, DNA, RNA, Value, P-Value, Element): <pre>--plugin satMutMPRA, file=/path/to/satMutMPRA_GRCh38_ALL.gz, cols=ALL</pre> You may want to select only a specific subset of information to be reported, you can do this by specifying the specific columns as parameters to the plugin e.g. <pre>--plugin satMutMPRA, file=/path/to/satMutMPRA_GRCh38_ALL.gz, cols=Tags:DNA</pre> If a requested column is not found, the error message will report the complete list of available columns in the satMutMPRA file. For a detailed description of the available information please refer to the manuscript or online web server. Tabix also allows the data file to be hosted on a remote server. This plugin is fully compatible with such a setup - simply use the URL of the remote file: <pre>--plugin satMutMPRA, file=http://my.files.com/satMutMPRA.gz</pre> Note that gene locations referred to in satMutMPRA may be out of sync with those in the latest release of Ensembl; this may lead to discrepancies with information retrieved from other sources. Usage examples: <pre>mv satMutMPRA.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin satMutMPRA, file=/path/to/satMutMPRA_data.gz, cols=col1:col2</pre>			
SingleLetterAA 	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that returns a HGVS string with single amino acid letter codes Usage examples: <pre>mv SingleLetterAA.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin SingleLetterAA</pre>	HGVS	-	Ensembl
SpliceAI 	An Ensembl VEP plugin that retrieves pre-calculated annotations from SpliceAI. SpliceAI is a deep neural network, developed by Illumina, Inc that predicts splice junctions from an arbitrary pre-mRNA transcript sequence. By default, this plugin appends all scores from SpliceAI files. The plugin works with any file outputted by the SpliceAI tool - Ensembl provides scores for all SNVs overlapping MANE transcripts. For more details see: 1. Download the input files Delta score of a variant, defined as the maximum of (DS_AG, DS_AL, DS_DG, DS_DL), ranges from 0 to 1 and can be interpreted as the probability of the variant being splice-altering. The author-suggested cutoffs are:	Splicing predictions	List::Util  qw(max)	Ensembl
This website requires cookies, and the limited processing of your personal data in order to function. By using the site 0.2 (high recall) - you are agreeing to this as outlined in our Privacy Policy and Terms of Use 0.5 (recommended)				

Plugin	Description	Category	External libraries	Developer	
	● 0.8 (high precision) This plugin is available for both GRCh37 and GRCh38. More information can be found at: https://pypi.org/project/spliceai/ Please cite the SpliceAI publication alongside Ensembl VEP if you use this resource: https://www.ncbi.nlm.nih.gov/pubmed/30661751 Running options: cutoff : Only return the scores for the specified cutoff Accepted values are between 0 and 1 split_output : Return each type of score in a different header. This is easier for parsing the output file. Output: The output includes the gene symbol, delta scores (DS) and delta positions (DP) for acceptor gain (AG), acceptor loss (AL), donor gain (DG), and donor loss (DL). ● For tab the output contains one header "SpliceAI_pred" with all the delta scores and positions. The format is: "SYMBOLIDS_AGIDS_ALIDS_DGIDS_DLIDP_AGIDP_ALIDP_DGIDP_DL" ● For JSON the output is a hash with the following format: "spliceai": { "DP_DL":0, "DS_AL":0, "DP_AG":0, "DS_DL":0, "SYMBOL": "X", "DS_AG":0, "DP_AL":0, "DP_DG":0, "DS_DG":0 } ● For VCF output and option <code>split_output</code> the delta scores and positions are stored in different headers. The values are "SpliceAI_pred_xx" being "xx" the score/position. Example: "SpliceAI_pred_DS_AG" is the delta score for acceptor gain. Gene matching: SpliceAI can contain scores for multiple genes that overlap a variant, and Ensembl VEP can also predict consequences on multiple genes for a given variant. The plugin only returns SpliceAI scores for the gene symbols that match (if any). If plugin is run with option 2, the output also contains a flag: "PASS" if delta score passes the cutoff, "FAIL" otherwise. The following steps are necessary to run this plugin: 1. Download the input files: ● Ensembl-generated files (only available for GRCh38) We calculated SpliceAI scores for all possible substitutions (SNV) within MANE Select transcripts. The scores are available through the Ensembl FTP at https://ftp.ensembl.org/pub/data_files/homo_sapiens/GRCh38/variation_plugins/ Note: Ensembl does not provide INDEL annotations, please use the Illumina's files for INDEL scores. To know more details on how the scores were calculated please read: https://ftp.ensembl.org/pub/data_files/homo_sapiens/GRCh38/variation_plugins/README ● Illumina-generated files Illumina calculated scores for all possible substitutions (SNV), 1 base insertions and 1-4 base deletions (INDEL), within genes are available through basespace (https://basespace.illumina.com/s/otSPW8hnhazR). ● To download via Illumina's basespace: 1. Log-in to your Illumina account or sign-up (for free) if you do not have one. 2. Once you're in, a "Share Project" pop-up will appear - click "accept". 3. A smaller pop-up in the bottom right will then read "you are agreeing to this as outlined in our Privacy Policy and Terms of Use "Share Accepted". Click "Predicting splicing from primary				

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

sequence". 4. You will get a list of files. Select "genome_scores_v1.3". 5. You will get an info/landing page. Under "Analysis: genome_scores_v1.3", select "FILES". 6. Click the file icon next to "genome_scores_v1.3" and you will get a list of available files. 7. Click filenames to download the relevant files - note that raw/masked, hg19/hg38 and snv/indel files are available.

2. For Illumina files: tabix the files (.tbi files are provided for Ensembl-derived VCFs).

- GRCh37: tabix -p vcf spliceai_scores.raw.snv.hg19.vcf.gz
tabix -p vcf spliceai_scores.raw.indel.hg19.vcf.gz
- GRCh38: tabix -p vcf spliceai_scores.raw.snv.hg38.vcf.gz
tabix -p vcf spliceai_scores.raw.indel.hg38.vcf.gz

3. The plugin can then be run:

- With Illumina files: ./vep -i variations.vcf --plugin SpliceAI,snv=/path/to/spliceai_scores.raw.snv.hg38.vcf.gz,indel=/path/to/spliceai_scores.raw.indel.hg38.vcf.gz ./vep -i variations.vcf --plugin SpliceAI,snv=/path/to/spliceai_scores.raw.snv.hg38.vcf.gz,indel=/path/to/spliceai_scores.raw.indel.hg38.vcf.gz,cutoff=0.5
./vep -i variations.vcf --plugin SpliceAI,snv=/path/to/spliceai_scores.raw.snv.hg38.vcf.gz,indel=/path/to/spliceai_scores.raw.indel.hg38.vcf.gz,split_output=1
- Or with Ensembl files (only for SNV): ./vep -i variations.vcf --plugin SpliceAI,snv=/path/to/spliceai_scores.masked.snv.ensembl_manifest_v1.4.grch38.vcf.gz,indel=/path/to/spliceai_scores.masked.indel.hg38.vcf.gz

Usage examples:

```
mv SpliceAI.pm ~/.vep/Plugins
./vep -i variations.vcf --plugin
SpliceAI,snv=/path/to/spliceai_snv_.vcf.gz,
indel=/path/to/spliceai_indel_.vcf.gz
```

SpliceRegion 	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that provides more granular predictions of splicing effects. Three additional terms may be added: # splice_donor_5th_base_variant : variant falls in the 5th base after the splice donor junction (5' end of intron) v ...EEEEEEEEIIIIIIIIII... (E = exon, I = intron, v = variant location) # splice_donor_region_variant : variant falls in region between 3rd and 6th base after splice junction (5' end of intron) vv vv ...EEEEEEEEIIIIIIIIII...	Splicing predictions -	Ensembl
--	--	---	--------------------

splice_polypyrimidine_tract_variant : variant falls in polypyrimidine

Plugin	Description	Category	External libraries	Developer
	<pre>vvvvvvvvvvvvvvvv ...IIIIIIIIIIIIIIIIIIIEEEE...</pre>			
Usage examples: <pre>mv SpliceRegion.pm ~/.vep/Plugins ./vep -i variations.vcf --plugin SpliceRegion</pre> To only show the additional consequence extended_intronic_splice_region_variant, use: <pre>./vep -i variations.vcf --plugin SpliceRegion,Extended</pre>

and, for GRCh37 assembly can be downloaded from here:

- https://ftp.ensembl.org/pub/current_variation/SpliceVault/SpliceVault_data_hg19.tsv.gz
- https://ftp.ensembl.org/pub/current_variation/SpliceVault/SpliceVault_data_hg19.tsv.gz.tbi

To filter results, please use filter_vep with the output file or standard output. Documentation on filter_vep is available at: https://www.ensembl.org/info/docs/tools/vep/script/vep_filter.html

Usage examples:

```
mv SpliceVault.pm ~/.vep/Plugins

./vep -i variations.vcf --plugin
SpliceVault,file=/path/to/SpliceVault_data_GRCh
38.tsv.gz

# Stringently select predicted loss-of-function
(pLoF) splicing variants
./filter_vep -i variant_effect_output.txt --
filter "SPICEVAULT_OUT_OF_FRAME_EVENTS >= 3"
```

SubsetVCF

An Ensembl VEP plugin to retrieve overlapping records from a given VCF file. Values for POS, ID, and ALT, are retrieved as well as values for any requested INFO field. Additionally, the allele number of the matching ALT is returned.

Though similar to using --custom, this plugin returns all ALTs for a given POS, as well as all associated INFO values.

By default, only VCF records with a filter value of "PASS" are returned, however this behaviour can be changed via the filter option.

The plugin accepts the following key=value parameters:

Argument	Description
name	short name added used as a prefix (required)
file	path to tabix-index vcf file (required)
filter	only consider variants marked as PASS, 1 or 0 (default, 1)
fields	info fields to be returned (default, not used) • '%' can delimit multiple fields • '*' can be used as a wildcard

Returns:

- <name>_POS: POS field from VCF
- <name>_REF: REF field from VCF (minimised)

- <name>_ALT_index: Index of matching variant (zero-based)
- <name>_alt_index: Index of matching variant (zero-based)

Variant data

- [Data::Dumper](#)
- [Storable](#) qw(dclone)

Joseph A. Prinz

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

- <name>_<field>: List of requested info values

Usage examples:

```
./vep -i variations.vcf --plugin
SubsetVCF,file=filepath.vcf.gz,name=myvfc,field
s=AC*%AN*
```

[TranscriptAnnotator](#)

An Ensembl VEP plugin that annotates variant-transcript pairs based on a given file:

Transcript annotation

File::Basenamer

Ensembl

```
--plugin
TranscriptAnnotator,file=${HOME}/file.tsv.gz
```

Example of a valid tab-separated annotation file:

```
#Chrom Pos Ref Alt Transcript
SIFT_score SIFT_pred Comment
11 436154 A G NM_001347882.2
0.03 Deleterious Bad
11 1887471 C T ENST00000421485
0.86 Tolerated Good
```

Please bgzip and tabix the file with commands such as:

```
bgzip file.txt
tabix -b2 -e2 file.txt.gz
```

Options are passed to the plugin as key=value pairs:

Argument	Description
file	(mandatory) Tabix-indexed file to parse. Must contain variant location (chromosome, position, reference allele, alternative allele) and transcript ID as the first 5 columns. Accepted transcript IDs include those from Ensembl and RefSeq.
columns	Colon-delimited list with names of the columns to append. Column names are based on the last header line. By default, all columns (except the first 5) are appended.
prefix	String to prefix the name of appended columns (default: basename of the filename without extensions). Set to 0 to avoid any prefix.
trim	Trim whitespaces from both ends of each column (default: 1).

The tabix and bgzip utilities must be installed in your path to read the tabix-indexed annotation file: check <https://github.com/samtools/htslib.git> for installation instructions.

Usage examples:

```
mv TranscriptAnnotator.pm ~/.vep/Plugins
./vep -i variations.vcf --plugin
TranscriptAnnotator,file=/path/to/file.txt.gz
```

Plugin	Description	Category	External libraries	Developer
--------	-------------	----------	--------------------	-----------

Usage examples:

```
mv TSSDistance.pm ~/.vep/Plugins
./vep -i variations.vcf --plugin TSSDistance

# Get both up and downstream distances:
./vep -i variations.vcf --plugin
TSSDistance,both_direction=1
```

UTRAnnotator

An Ensembl VEP plugin that annotates the effect of 5' UTR variant especially for variant creating/disrupting upstream ORFs. Available for both GRCh37 and GRCh38.

Transcript
annotation

- [List::Util](#) qw(min max)
- [Scalar::Util](#) qw(looks_like_number)

Ensembl

Options are passed to the plugin as key=value pairs:

Argument	Description
file	(Required) Path to UTRAnnotator data file: • Download uORF_5UTR_GRCh37_PUBLIC.txt or uORF_5UTR_GRCh38_PUBLIC.txt from https://github.com/Ensembl/UTRannotator • Download from http://sorfs.org
max_overlap	(Optional) Maximum percentage of overlap between variant and UTR for UTR annotation (default: 100)

Citation

About the role of 5'UTR variants in human genetic disease:

Whiffin, N., Karczewski, K.J., Zhang, X. et al. Characterising the loss-of-function impact of 5' untranslated region variants in 15,708 individuals. Nat Commun 11, 2523 (2020).
<https://doi.org/10.1038/s41467-019-10717-9>

About UTRAnnotator:

The original UTRAnnotator plugin is written by Xiaolei Zhang et al. Later adopted by Ensembl VEP plugins with some changes. You can find the original plugin here - <https://github.com/ImperialCardioGenetics/UTRannotator>

Please cite the UTRannotator publication alongside Ensembl VEP if you use this resource - Annotating high-impact 5'untranslated region variants with the UTRannotator Zhang, X., Wakeling, M.N., Ware, J.S, Whiffin, N. Bioinformatics; doi: <https://academic.oup.com/bioinformatics/advance-article/doi/10.1093/bioinformatics/btaa783/5905476>

Usage examples:

```
mv UTRAnnotator.pm ~/.vep/Plugins
vep -i variations.vcf --plugin
UTRAnnotator,file=/path/to/uORF_starts_ends_GRC
h38_PUBLIC.txt

# skip annotation for variants with a 80% or
higher overlap of the UTR
vep -i variations.vcf --plugin
```

Plugin	Description	Category	External libraries	Developer
	UTRAnnotator, <code>file=/path/to/uORF_starts_ends_GRC_h38_PUBLIC.txt,max_overlap=80</code>			
VARITY	This is a plugin for the Ensembl Variant Effect Predictor (VEP) that adds the pre-computed VARITY scores to predict pathogenicity of rare missense variants to the output. Please cite the VARITY publication alongside Ensembl VEP if you use this resource: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8715197/ Running options : VARITY scores can be downloaded using <pre>wget http://varity.varianteffect.org/downloads/varity_all_predictions.tar.gz</pre> The files can be tabix processed by : <pre>tar -xzf varity_all_predictions.tar.gz cat varity_all_predictions.txt (head -n 1 && tail -n +2 sort -t\$'\t' -k 1,1 -k 2,2n) > varity_all_predictions_sorted.tsv sed '1s/.*/#&/' varity_all_predictions_sorted.tsv > varity_all_predictions.tsv # to add a # in the first line of the file bgzip varity_all_predictions.tsv tabix -f -s 1 -b 2 -e 2 varity_all_predictions.tsv.gz</pre> Requirements: The tabix utility must be installed in your path to use this plugin. The --assembly flag is required to use this plugin. Usage examples: <pre>mv VARITY.pm ~/.vep/Plugins ./vep -i variations.vcf --assembly GRCh37 -- plugin VARITY, file=/path/to/varity_all_predictions.txt</pre>	Pathogenicity predictions	-	Ensembl

We hope that these will serve as useful examples for users implementing new plugins. If you have any questions about the system, or suggestions for enhancements please let us know on the [ensembl-dev](#) mailing list. We also encourage you to share any plugins you develop: we are happy to accept pull requests on the [VEP plugins](#) git repository.

There are further published plugins available outside the Ensembl VEP repository including:

[LOFTEE](#) a Loss-Of-Function Transcript Effect Estimator ([Konrad Karczewski et al,2020](#))

How it works

Plugins are run once Ensembl VEP has finished its analysis for each line of the output, but before anything is printed to the output file.

When each plugin is called (using the `run` method) it is passed two data structures to use in its analysis; the first is a data structure containing all the data for the current line, and the second is a reference to a variation API object that represents the combination of a variant allele and an overlapping or nearby genomic feature (such as a transcript or regulatory region).

This website provides access to all the relevant API objects that may be useful for further analysis by the plugin (such as the VariationFeature and Transcript). Please refer to the [Ensembl Variation API documentation](#) for more details. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#).

Functionality

We expect that most plugins will simply add information to the last column of the output file, the "Extra" column, and the plugin system assumes this in various places, but plugins are also free to alter the output line as desired.

The only hard requirement for a plugin to work with Ensembl VEP is that it implements a number of required methods (such as *new* which should create and return an instance of this plugin, *get_header_info* which should return descriptions of the type of data this plugin produces to be included in Ensembl VEP output's header, and *run* which should actually perform the logic of the plugin).

To make development of plugins easier, we suggest that users use the [Bio::EnsEMBL::Variation::Utils::BaseVepPlugin](#) module as their base class, which provides default implementations of all the necessary methods which can be overridden as required. Please refer to the documentation in this module for details of all required methods and for a simple example of a plugin implementation.

Filtering using plugins

A common use for plugins will be to filter the output in some way (for example to limit output lines to missense variants) and so we provide a simple mechanism to support this.

The *run* method of a plugin is assumed to return a reference to a hash containing information to be included in the output, and if a plugin should not add any data to a particular line it should return an empty hashref. If a plugin should instead filter a line and exclude it from the output, it should return *undef* from its *run* method, this also means that no further plugins will be run on the line.

If you are developing a filter plugin, we suggest that you use the [Bio::EnsEMBL::Variation::Utils::BaseVepFilterPlugin](#) as your base class and then you need only override the *include_line* method to return true if you want to include this line, and false otherwise. Again, please refer to the documentation in this module for more details and an example implementation of a missense filter.

Using plugins

In order to run a plugin you need to include the plugin module in Perl's library path somehow; by default Ensembl VEP includes the *~/vep/Plugins* directory in the path, so this is a convenient place to store plugins, but you are also able to include modules by any other means (e.g using the *\$PERL5LIB* environment variable in Unix-like systems).

You can then run a plugin using the `--plugin` command line option, passing the name of the plugin module as the argument.

For example, if your plugin is in a module called *MyPlugin.pm*, stored in *~/vep/Plugins*, you can run it with a command line like:

```
./vep -i input.vcf --plugin MyPlugin
```

You can pass arguments to the plugin's 'new' method by including them after the plugin name on the command line, separated by commas, e.g.:

```
./vep -i input.vcf --plugin MyPlugin,1,FOO
```

If your plugin inherits from *BaseVepPlugin*, you can then retrieve these parameters as a list from the *params* method.

You can run multiple plugins by supplying multiple `--plugin` arguments. Plugins are run serially in the order in which they are specified on the command line, so they can be run as a pipeline, with, for example, a later plugin filtering output based on the results from an earlier plugin. Note though that the first plugin to filter a line 'wins', and any later plugins won't get run on a filtered line.

Intergenic variants

When a variant falls in an intergenic region, it will usually not have any consequence types called, and hence will not have any associated *VariationFeatureOverlap* objects. In this special case, Ensembl VEP creates a new *VariationFeatureOverlap* that overlaps a feature of type "Intergenic".

To force your plugin to handle these, you must add "Intergenic" to the feature types that it will recognize; you do this by writing your own *feature_types* sub-routine:

```
sub feature_types {  
    return ['Transcript', 'Intergenic'];  
}
```

This will cause your plugin to handle any variation features that overlap transcripts or intergenic regions. To also include features, you should use the generic type "Feature".

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

```
sub feature_types {  
  return ['Feature', 'Intergenic'];  
}
```

Example commands

- Read input from **STDIN**, output to **STDOUT**

```
./vep --cache -o stdout
```

- Add **regulatory** region **consequences**

```
./vep --cache -i variants.txt --regulatory
```

- Input file variants.vcf.txt, input file **format VCF**, add **gene symbol** identifiers

```
./vep --cache -i variants.vcf.txt --format vcf --symbol
```

- Filter out common variants** based on 1000 Genomes data

```
./vep --cache -i variants.txt --filter_common
```

- Force overwrite** of output file variants_output.txt, check for existing **co-located variants**, output only **coding sequence** consequences, output **HGVS names**

```
./vep --cache -i variants.txt -o variants_output.txt --force --check_existing --coding_only --hgvs
```

- Specify **DB connection parameters** in registry file ensembl.registry, add **SIFT** score and prediction, **PolyPhen** prediction

```
./vep --database -i variants.txt --registry ensembl.registry --sift b --polyphen p
```

- Connect to **Ensembl Genomes** db server for *Arabidopsis thaliana*

```
./vep --database -i variants.txt --genomes --species arabidopsis_thaliana
```

- Load config from **ini file**, run in **quiet mode**

```
./vep --config vep.ini -i variants.txt -q
```

- Use **cache** in /home/vep/mycache/, use **gzcat** instead of zcat

```
./vep --cache --dir /home/vep/mycache/ -i variants.txt --compress gzcat
```

- Add custom position-based **phenotype** annotation from remote **BED file**

```
./vep --cache -i variants.vcf --custom  
file=ftp://ftp.myhost.org/data/phenotypes.bed.gz,short_name=phenotype
```

- Use the **plugin** named MyPlugin, output only the variation name, feature, consequence type and MyPluginOutput **fields**

```
./vep --cache -i variants.vcf --plugin MyPlugin --fields  
Uploaded_variation,Feature,Consequence,MyPluginOutput
```

- Right align variants before consequence calculation. For more information, see [here](#).

- Report uploaded allele before minimisation. For more information, see [here](#).

```
./vep --cache -i variants.vcf --uploaded_allele
```

gnomAD

[gnomAD](#) exome frequency data is included in Ensembl VEP's cache files from release 90, replacing ExAC; use `--af_gnomad` to enable using this data. Ensembl VEP can also retrieve frequency data from the gnomAD genomes set or ExAC via Ensembl VEP's custom annotation functionality.

For the latest gnomAD data, please visit [gnomAD downloads](#).

1. Ensembl VEP requires Bio::DB::HTS to read data from tabix-indexed VCFs - see [installation instructions](#)
2. The Ensembl FTP site hosts abridged VCF files for gnomAD additionally remapped to GRCh38 using [CrossMap](#). It is possible for Ensembl VEP to read these files directly from their remote location, though for optimal performance the VCF and index should be downloaded to a local file system.

● GRCh38

- gnomAD genomes (r2.1, remapped with CrossMap): [VCFs and tabix indexes](#)
- gnomAD exomes (r2.1, remapped with CrossMap): [VCFs and tabix indexes](#)
- ExAC (v0.3, remapped using CrossMap): [VCF](#) [tabix index](#)

● GRCh37

- gnomAD genomes (r2.1): [VCF and tabix indexes](#)
- gnomAD exomes (r2.1): [VCF and tabix indexes](#)
- ExAC (v0.3): [VCF](#) [tabix index](#)

3. Run Ensembl VEP with the following command (using the GRCh38 input example) to get locations and continental-level allele frequencies:

```
./vep -i examples/homo_sapiens_GRCh38.vcf --cache \
--custom
file=gnomad.genomes.r2.0.1.sites.GRCh38.noVEP.vcf.gz,short_name=gnomADg,format=vcf,type=exact,coo
ords=0,fields=AF_AFR%AF_AMR%AF_ASJ%AF_EAS%AF_FIN%AF_NFE%AF_OTH
```

You will then see data under field names as described in the Ensembl VEP output header:

```
## gnomADg : gnomad.genomes.r2.0.1.sites.GRCh38.noVEP.vcf.gz (exact)
## gnomADg_AFR_AF : AFR_AF field from gnomad.genomes.r2.0.1.sites.GRCh38.noVEP.vcf.gz
## gnomADg_AMR_AF : AMR_AF field from gnomad.genomes.r2.0.1.sites.GRCh38.noVEP.vcf.gz
...
```

where the gnomADg field contains the ID (or coordinates if no ID found) of the variant in the VCF file. Any of the fields in the gnomAD file INFO field can be added by appending them to the list in your Ensembl VEP command.

Conservation scores

You can use the [custom annotation](#) feature to add conservation scores to your output. For example, to add GERP scores, download the bigWig file from the list below, and run Ensembl VEP with the following flag:

```
./vep --cache -i example.vcf --custom file=All_hg19_RS.bw,short_name=GERP,format=bigwig
```

Example conservation score files:

Human (GRCh38)

- [phastCons 7-way](#)

Human (GRCh37)

- [GERP](#)

- [phastCons 20-way](#)

- [phastCons 46-way](#)

- [phastCons 100-way](#)

- [phastCons 100-way](#)

- [phyloP 7-way](#)

- [phyloP 46-way](#)

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- [phyloP 20-way](#)
- [phyloP 100-way](#)
- [phyloP 100-way](#)

All files provided by the UCSC genome browser - files for other species are available from their [FTP site](#), though be sure to use the file corresponding to the [correct assembly](#).

dbNSFP

dbNSFP - "[a lightweight database of human nonsynonymous SNPs and their functional predictions](#)" - provides pathogenicity predictions from many tools (including SIFT, LRT, MutationTaster, FATHMM) across every possible missense substitution in the human proteome.

Ensembl VEP plugins sometimes require data processed in specific ways as arguments. Any requirements and usage instructions for each plugin can be found in the [plugin documentation](#).

In the case of the dbNSFP.pm plugin, the data needs to be [downloaded](#) and then processed into a format that the plugin can use. Note that there are two distinct branches of the files provided for academic and commercial usage; please use the appropriate files for your use case.

After downloading the file, you will need to process it so that tabix can index it correctly. This will take a while as the file is very large! Note that you will need the [tabix](#) utility in your path to use dbNSFP.

```
version=4.5c
unzip dbNSFP${version}.zip
zcat dbNSFP${version}_variant.chr1.gz | head -n1 > h

# GRCh38/hg38 data
zgrep -h -v "^#chr" dbNSFP${version}_variant.chr* | sort -k1,1 -k2,2n - | cat h - | bgzip -c >
dbNSFP${version}_grch38.gz
tabix -s 1 -b 2 -e 2 dbNSFP${version}_grch38.gz

# GRCh37/hg19 data
zgrep -h -v "^#chr" dbNSFP${version}_variant.chr* | awk '$8 != "." ' | sort -k8,8 -k9,9n - | cat h
- | bgzip -c > dbNSFP${version}_grch37.gz
tabix -s 8 -b 9 -e 9 dbNSFP${version}_grch37.gz
```

Then simply download the [dbNSFP.pm plugin](#) and place it either in **\$HOME/vep/Plugins/** or a path in your **\$PERL5LIB**. When you run Ensembl VEP with the plugin, you will need to select some of the columns that you wish to retrieve; to list them run Ensembl VEP with the plugin and the path to the dbNSFP file and no further parameters:

```
./vep --cache --force --plugin dbNSFP,dbNSFP4.5c_grch38.txt.gz
2014-04-04 11:27:05 - Read existing cache info
2014-04-04 11:27:05 - Auto-detected FASTA file in cache directory
2014-04-04 11:27:05 - Checking/creating FASTA index
2014-04-04 11:27:05 - Failed to instantiate plugin dbNSFP: ERROR: No columns selected to fetch.
Available columns are:
#chr,pos(1-coor),ref,alt,aaref,aaalt,hg18_pos(1-coor),genename,Uniprot_acc,
Uniprot_id,Uniprot_aapos,Interpro_domain,cds_strand,refcodon,SLR_test_statistic,
codonpos,fold-degenerate,Ancestral_allele,Ensembl_geneid,Ensembl_transcriptid,
...
```

Note that some of these fields are replicates of those produced by the core Ensembl VEP code (e.g. [SIFT](#), the [1000 Genomes Project](#) frequencies) - you should use the Ensembl VEP options for frequency information rather than the annotations from dbNSFP as the dbNSFP file covers **only** missense substitutions. Other fields, such as the conservation scores, may be better served by using genome-wide files as described [above](#).

To select fields, just add them as a comma-separated list to your command line:

```
./vep --cache --force --plugin
dbNSFP,dbNSFP4.5c_grch38.txt.gz,LRT_score,FATHM_score,MutationTaster_score
```

One final point to note is that the dbNSFP scores are frozen on a particular Ensembl release's transcript set; check the readme file on their download site to find out exactly which. While in the majority of cases protein sequences don't change between releases, this website requires cookies, and the limited processing of your personal data in order to function. By using the site, you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#).

Structural variants

Ensembl VEP can annotate structural variants (SV) with their predicted effect on other genomic features. For more information on SV input format, see [here](#).

Prediction process

- If the INFO keys **END** or **SVLEN** are present, the proportion of any overlapping feature covered by the variant is calculated
- The alternative allele (or **SVTYPE** in older VCF files) defines the type of structural variant; some types of structural variants are tested for specific consequences:

Structural variant type	Abbreviation	Specific consequences
Insertion	INS	Feature elongation
Deletion	DEL	Feature truncation
Duplication	DUP	Feature amplification/elongation
Inversion	INV	<i>Not tested for any specific consequence</i>
Copy number variation	CNV	Feature amplification/elongation (if copy number is 2) or truncation (if copy number is 0)
Breakpoint variant	BND	Feature truncation

Insertions and deletions

- Supports [mobile element insertions/deletions](#), including ALU, HERV, LINE1 and SVA elements
 - Currently, mobile element variants are treated as any insertion/deletion

Breakpoint variants

- Supports chromosome synonyms in breakends (such as **chr4** and **NC_000004.12**)
- Processes [single breakends and multiple, comma-separated alternative breakends](#)
- Consequences are reported for each breakend; for instance, for a VCF input like **1 7936271 . N N[12:58877476[,N[X:10932343[**, it will report the consequences for each of the 3 breakends:
 - **N[12:58877476[**: consequences for the first alternative breakend near chr12:58877476
 - **N[X:10932343[**: consequences for the second alternative breakend near chrX:10932343
 - **N.**: consequences for the reference breakend near chr1:7936271 (represented as detailed in the [VCF 4.4 specification, section 5.4.9: Single breakends](#))
- In case of specific breakends not overlapping any reported Ensembl features (such as transcripts and regulatory regions), that specific breakend will **NOT** be presented in VEP output.

Reported overlaps

- Ensembl VEP calculates the length and proportion of each genomic feature overlapped by a structural variant
- Use the [--overlaps](#) option to enable this when using VCF or tab format. (This is reported by default in standard Ensembl VEP and JSON format.)
- The keys **bp_overlap** and **percentage_overlap** are used in JSON format and **OverlapBP** and **OverlapPC** in other formats.

Plugin support

- [CADD plugin](#)
- [Conservation plugin](#)
- [NearestGene plugin](#)
- [Phenotypes plugin](#)
- [StructuralVariantOverlap plugin](#): please note that all features of this plugin have been ported to [--custom annotation](#), with additional improvements
- [TSSDistance plugin](#)

Changing memory requirements

- By default, Ensembl VEP does not annotate variants larger than 10M. If you are using the command line tool, you can [max_sv_size](#) option to modify this.
- This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

- This limit is not associated with breakpoint variants: each breakend in a breakpoint variant is analysed by Ensembl VEP as a single base (the alternative sequence is currently ignored).
- By default, variants are analysed in batches of 5000. Using the `--buffer_size` option to reduce this can reduce memory requirements, especially if your data is sparse. A smaller buffer size is essential when annotating structural variants with regulatory data.

Pangenome assemblies

Ensembl VEP is able to analyse variants in **any species or assembly** (even if not part of [Ensembl data](#)) by providing your own [FASTA file](#) and [GFF/GTF annotation](#):

```
./vep -i variants.txt -o variants_output.txt --gff data.gff.gz --fasta genome.fa.gz
```

We also provide data for other assemblies besides those supported in the current Ensembl and Ensembl Genomes sites.

HPRC assemblies

The [Human Pangenome Reference Consortium \(HPRC\)](#) aims to sequence 350 individuals of diverse ancestries, producing a pangenome of 700 haplotypes by the end of 2024. The first publication ([A draft human pangenome reference](#)) describes 47 phased, diploid assemblies from a cohort of genetically diverse individuals.

The Ensembl VEP command-line tool (CLI) can annotate and filter variants called against the latest human assemblies, including the telomere-to-telomere assembly of the CHM13 cell line (T2T-CHM13). We have annotated genes on these human assemblies, based on Ensembl/[GENCODE 38](#) genes and transcripts, via a new mapping pipeline as detailed in the Methods section of [A draft human pangenome reference](#). The links to download and visualise the human annotations for HPRC assemblies are summarised in the [Ensembl HPRC data page](#).

Running Ensembl VEP with the human HPRC assemblies

Currently, Ensembl VEP can only be run with HPRC assemblies in offline mode, one assembly at a time. There are two ways to use Ensembl VEP with HPRC assemblies:

- Using **Ensembl VEP cache** with (recommended) **FASTA sequence** (the most efficient way)
- Using **GTF annotation** with (mandatory) **FASTA sequence**

In the examples below, we demonstrate annotating variants on **T2T-CHM13v2.0** ([GCA_009914755.4](#) assembly). To create a sample VCF to use in the examples below, you can take the first 100 lines from the ClinVar VCF file mapped to T2T-CHM13:

```
clinvar=ftp://ftp.ensembl.org/pub/rapid-release/species/Homo_sapiens/GCA_009914755.4/ensembl/variation/2022_10/vcf/2024_07/clinvar_20240624_GCA_009914755.4.vcf.gz
tabix -h $clinvar 1 | head -n 100 > test.vcf
```

Ensembl VEP cache

The [cache](#) is a downloadable archive containing all transcript models for an assembly; it may also contain regulatory features and variant data.

Let's start by downloading and extracting the cache to the default Ensembl VEP directory (available for each annotation by clicking in **VEP cache** in the [Ensembl HPRC data page](#)). In the case of T2T-CHM13:

```
cd $HOME/.vep
curl -O https://ftp.ensembl.org/pub/rapid-release/species/Homo_sapiens/GCA_009914755.4/ensembl/variation/2022_10/indexed_vep_cache/Homo_sapiens-GCA_009914755.4-2022_10.tar.gz
tar xzf Homo_sapiens-GCA_009914755.4-2022_10.tar.gz
```

This will create the folder `homo_sapiens_gca009914755v4/107_T2T-CHM13v2.0` with the gene data required to run Ensembl VEP. The name of this folder contains relevant information when running Ensembl VEP:

- Species: `homo_sapiens_gca009914755v4`
- Cache version: 107

- Assembly: `T2T-CHM13v2.0`

This website requires cookies, and the limited processing of your personal data in order to function. By using the site As well as molecular consequence predictions, many gene/transcript-based options are supported for HPRC assemblies you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

```
vep -i test.vcf --offline \
--species homo_sapiens_gca009914755v4 \
--cache_version 107 \
--fasta Homo_sapiens-GCA_009914755.4-softmasked.fa.gz \
--domains --symbol --canonical --protein --biotype --uniprot --variant_class
```

We don't have other annotations, such as RefSeq transcripts or variant information in the cache.

To run Ensembl VEP with the downloaded cache in offline mode, please specify the species (which here includes assembly name) and cache version:

```
vep -i test.vcf --offline --species homo_sapiens_gca009914755v4 --cache_version 107
```

FASTA sequence

When using the cache, supplying the reference genomic sequence in a FASTA file is optional, but is required to enable the following options:

- Create HGVS notations ([--hgvs](#) and [--hgvs_g](#))
- Check the reference sequence given in input data ([--check_ref](#))

Genomic FASTA files can be found in [Ensembl HPRC data page](#) > **FTP dumps > ensembl > genome**. FASTA files need to be either uncompressed or compressed with **bgzip** (recommended) to be compatible with Ensembl VEP. For instance, to download a compressed FASTA file, uncompress it and then re-compress it with bgzip:

```
curl -O https://ftp.ensembl.org/pub/rapid-
release/species/Homo_sapiens/GCA_009914755.4/ensembl/genome/Homo_sapiens-GCA_009914755.4-
softmasked.fa.gz
gzip -d Homo_sapiens-GCA_009914755.4-softmasked.fa.gz
bgzip Homo_sapiens-GCA_009914755.4-softmasked.fa.gz
```

Afterwards, you can run Ensembl VEP using cache and the [--fasta](#) flag:

```
vep -i test.vcf --offline \
--species homo_sapiens_gca009914755v4 \
--cache_version 107 \
--fasta Homo_sapiens-GCA_009914755.4-softmasked.fa.gz
```

More information on using FASTA files is available [here](#).

GTF and GFF annotation

As an alternative to using cache files, Ensembl VEP can utilise gene information in appropriately indexed GTF or GFF files. GTF and GFF files can be downloaded from the annotation column in the [Ensembl HPRC data page](#). The data needs to be re-sorted in chromosomal order, compressed in **bgzip** and indexed with **tabix**. We present here the example for a GTF file:

```
curl -O https://ftp.ensembl.org/pub/rapid-
release/species/Homo_sapiens/GCA_009914755.4/ensembl/geneset/2022_07/Homo_sapiens-GCA_009914755.4-
2022_07-genes.gtf.gz
gzip -d Homo_sapiens-GCA_009914755.4-2022_07-genes.gtf.gz
grep -v "#" Homo_sapiens-GCA_009914755.4-2022_07-genes.gtf | \
sort -k1,1 -k4,4n -k5,5n -t$'\t' | \
bgzip -c > Homo_sapiens-GCA_009914755.4-2022_07-genes.gtf.gz
tabix Homo_sapiens-GCA_009914755.4-2022_07-genes.gtf.gz
```

FASTA files are **always** required when running HPRC data with GTF annotation, as the transcript sequences are not available in the GFF files.

Afterwards, you can run Ensembl VEP using the GTF and FASTA files:

```
vep -i test.vcf \
--gtf Homo_sapiens-GCA_009914755.4-2022_07-genes.gtf.gz \
```

This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Check [here](#) for more information on using gene annotations in GTF and GFF files.

Missense deleteriousness predictions

Although PolyPhen-2 and SIFT scores are not directly available for alternative assemblies by using `--polyphen` and `--sift`, they can be retrieved via the [PolyPhen_SIFT plugin](#).

Using our [ProteinFunction pipeline](#), we ran **PolyPhen-2 2.2.3** and **SIFT 6.2.1** on the proteome sequences for GRCh38 and all HPRC assemblies (the protein FASTA files indicated in [Ensembl HPRC data page](#)) and stored their results in a single SQLite file: [homo_sapiens_pangenome_PolyPhen_SIFT_20240502.db](#).

Pre-computed scores and predictions can be retrieved by downloading this file and using the **PolyPhen_SIFT plugin**:

```
curl -O
https://ftp.ensembl.org/pub/current_variation/pangenomes/Human/homo_sapiens_pangenome_PolyPhen_SIFT_20240502.db
vep -i test.vcf --offline \
    --species homo_sapiens_gca009914755v4 \
    --cache_version 107 \
    --fasta Homo_sapiens-GCA_009914755.4-softmasked.fa.gz \
    --plugin PolyPhen_SIFT,db=human_pangenomes.PolyPhen_SIFT.db
```

Matched variant annotations (ClinVar, gnomAD and dbSNP)

We don't have variant data in the caches for the HPRC assemblies, but it can be integrated using the `--custom` option with data files using the same assembly coordinates. We have lifted-over some key datasets, including ClinVar and gnomAD to the HPRC assemblies (downloadable from the VCF column in [Ensembl HPRC data page](#)).

```
# Download ClinVar data and respective index (TBI)
curl -O https://ftp.ensembl.org/pub/rapid-release/species/Homo_sapiens/GCA_009914755.4/ensembl/variation/2022_10/vcf/2024_07/clinvar_20240624_GCA_009914755.4.vcf.gz
curl -O https://ftp.ensembl.org/pub/rapid-release/species/Homo_sapiens/GCA_009914755.4/ensembl/variation/2022_10/vcf/2024_07/clinvar_20240624_GCA_009914755.4.vcf.gz.tbi

# Run Ensembl VEP with ClinVar data
vep -i test.vcf --offline \
    --species homo_sapiens_gca009914755v4 --cache_version 107 \
    --fasta Homo_sapiens-GCA_009914755.4-softmasked.fa.gz \
    --custom
file=clinvar_20240624_GCA_009914755.4.vcf.gz,short_name=ClinVar,format=vcf,type=exact,coords=0,filelds=CLNSIG%CLNREVSTAT%CLNDN
```

Additional annotations

Ensembl VEP plugins are a simple way to add new functionality to your analysis. Many require data that is only available for GRCh37 or GRCh38, but others, for example those based on gene attributes or on the fly analysis are compatible with the HGRC assemblies.

Here follows Ensembl VEP plugins that are easily compatible with alternative human assemblies:

Plugin	Description	Plugin data	Usage example
Blosum62	Looks up the BLOSUM 62 substitution matrix score for the reference and alternative amino acids predicted for a missense mutation.		<code>--plugin Blosum62</code>
DosageSensitivity	Retrieves haploinsufficiency and triplosensitivity probability scores for affected genes (Collins et al., 2022).	Collins_rCNV_2022.dosage_sensitivity_scores.tsv.gz	<code>--plugin DosageSensitivity,file=Collins_rCNV_2022.dosage_sensitivity_scores.tsv.gz</code>
Downstream	Predicts downstream effects of a frameshift variant on the protein sequence of a transcript.	Requires a FASTA file provided via the <code>--fasta</code> option	<code>--plugin Downstream</code>
Draw	Draws pictures of the transcript model showing the variant location.		<code>--plugin Draw</code>

Plugin	Description	Plugin data	Usage example
GeneSplicer	Runs GeneSplicer to get splice site predictions.	Binary and training data for GeneSplicer (plugin instructions)	--plugin GeneSplicer,binary=genesplicer/bin/linux/genesplicer,training=genesplicer/human
GO	Retrieves Gene Ontology (GO) terms associated with genes (for HGRC assemblies, specifically) using custom GFF annotation containing GO terms.	Ensembl HPRC data page > FTP dumps > ensembl > variation > [date] > gff: *_GO_plugin.gff.gz *_GO_plugin.gff.gz.tbi	--plugin GO,file=homo_sapiens_gca009914755v4_110_VEP_GO_plugin.gff.gz
HGVSIntronOffset	Returns HGVS intron start and end offsets. To be used with --hgvs option.		--plugin HGVSIntronOffset
LoFtool	Provides a rank of genic intolerance and consequent susceptibility to disease based on the ratio of Loss-of-function (LoF) to synonymous mutations for each gene.		--plugin LoFtool
MaxEntScan	Runs MaxEntScan to get splice site predictions.	Extracted directory from fordownload.tar.gz	--plugin MaxEntScan,/path/to/fordownload
NearestExonJB	Finds the nearest exon junction boundary to a coding sequence variant.		--plugin NearestExonJB
NMD	Predicts if a variant allows the transcript to escape nonsense-mediated mRNA decay based on certain rules.		--plugin NMD
Phenotypes	Retrieves overlapping phenotype information.	Ensembl HPRC data page > FTP dumps > ensembl > variation > [date] > gff: *_phenotypes_plugin.gvf.gz *_phenotypes_plugin.gvf.gz.tbi	--plugin Phenotypes,file=homo_sapiens_gca009914755v4_110_VEP_phenotypes_plugin.gvf.gz
pLI	Adds the probability of a gene being loss-of-function intolerant (pLI).		--plugin pLI
PolyPhen_SIFT	Retrieves PolyPhen and SIFT predictions from a SQLite database.	homo_sapiens_pangenome_PolyPhen_SIFT_20240502.db	--plugin PolyPhen_SIFT,db=homo_sapiens_pangenome_PolyPhen_SIFT_20240502.db
ProteinSeqs	Writes two files with the reference and mutated protein sequences of any proteins found with non-synonymous mutations in the input file.		--plugin ProteinSeqs
SingleLetterAA	Returns HGVS string with single amino acid letter codes.		--plugin SingleLetterAA
SpliceRegion	Provides more granular predictions of splicing effects.		--plugin SpliceRegion
SubsetVCF	Retrieves overlapping records from a given VCF file.	A VCF file	--plugin SubsetVCF,file=vcf.gz,name=myv

Plugin	Description	Plugin data	Usage example
TranscriptAnnotator	Annotates variant-transcript pairs based on a given file.	Tab-separated annotation file (plugin instructions)	--plugin TranscriptAnnotator, file=annotation.txt.gz
TSSDistance	Calculates the distance from the transcription start site for upstream variants.		--plugin TSSDistance

Citations and Ensembl VEP users

Ensembl VEP is used by many organisations and projects:

- Ensembl VEP forms a part of [Illumina's VariantStudio](#) software
- [Gemini](#) is a framework for exploring genome variation that uses Ensembl VEP
- The [DECIPHER project](#) uses Ensembl VEP to aid variant interpretation

Other citations and use cases:

- [VAX](#) is a suite of plugins that expand Ensembl VEP functionality
- [pViz](#) is a visualisation tool for Ensembl VEP results files
- [McCarthy et al](#) compares Ensembl VEP to AnnoVar
- [Pabinger et al](#) reviews variant analysis software, including Ensembl VEP
- Ensembl VEP is used to provide annotation for the [gnomAD](#) project
- For a fuller list of Ensembl VEP citations see EuropePMC information for our [2010](#), [2016](#) and [tutorial](#) publications.

Getting Ensembl VEP to run faster

Set up correctly, Ensembl VEP is capable of annotating around 3 million variants in 30 minutes. There are a number of steps you can take to make sure your installation is running as fast as possible:

1. Make sure you have the  [latest version](#) of Ensembl VEP and the underlying APIs. We regularly introduce optimisations, alongside the new features and bug fixes of a typical new release.
2. Download a [cache file](#) for your species. If you are using [--database](#), you should consider using [--cache](#) or [--offline](#) instead. Any time Ensembl VEP has to access data from the database (even if you have a local copy), it will be slower than accessing data in the cache on your local file system.

Enabling [certain flags](#) forces Ensembl VEP to access the database, and you will be warned at startup that it will do this with e.g.:

```
2011-06-16 16:24:51 - INFO: Database will be accessed when using --check_svs
```

Consider carefully whether you need to use these flags in your analysis.

3. If you use [--check_existing](#) or any flags that invoke it (e.g. [--af](#), [--af 1kg](#), [--filter common](#), [--everything](#)), [tabix-convert](#) your cache file. Checking for known variants using a converted cache is >100% faster than using the default format.
4. Download a [FASTA file](#) (and use the flag [--fasta](#)) if you use [--hgvs](#) or [--check_ref](#). Again, this will prevent Ensembl VEP accessing the database unnecessarily (in this case to retrieve genomic sequence).
5. Using forking enables Ensembl VEP to run multiple parallel "threads", with each thread processing a subset of your input. Most modern computers have more than one processor core, so running Ensembl VEP with forking enabled can give huge speed increases (3-4x faster in most cases). Even computers with a single core will see speed benefits due to overheads associated with using object-oriented code in Perl.

To use forking, you must choose a number of forks to use with the [--fork](#) flag. We recommend using 4 forks:

```
./vep -i my_input.vcf --fork 4 --offline
```

but depending on various factors specific to your setup you may see faster performance with fewer or more forks.

When writing [plugins](#) be aware that while the Ensembl VEP code attempts to preserve the state of any plugin-specific cached data between separate forks, there may be situations where data is lost. If you find this is the case, you should disable forking in the `new()` method of your plugin by deleting the "fork" key from the `$config` hash.

6. Make sure your cache and FASTA files are stored on the fastest file system or disk you have available. If you have a lot of memory in your machine, you can even pre-copy the files to memory using [tmpfs](#).
7. Consider if you need to generate HGVS notations ([--hgvs](#)); this is a complex annotation step that can add ~50-80% to your runtime. Note also that `--hgvs` is switched on by [--everything](#).
8. Install the [Set::IntervalTree](#) Perl package. This package speeds up annotation time by changing how overlaps between variants and transcript components are calculated.
9. Install the [Ensembl::XS](#) package. This contains compiled versions of certain key subroutines used in Ensembl VEP that will run faster than the default native Perl equivalents. Using this should improve runtime by 5-10%.
10. Add the [--no_stats](#) flag. Calculating summary statistics increases runtime, so can be switched off if not required.
11. Ensembl VEP is optimised to run on input files that are sorted by variant location. Unsorted files will still work, albeit much more slowly.
12. For very large files (for example those from whole-genome sequencing), Ensembl VEP processing can be easily parallelised by dividing your file into chunks (e.g. by chromosome). Ensembl VEP will also work with tabix-indexed, bgzipped VCF files, and so the `tabix` utility could be used to divide the input file:

```
tabix -h variants.vcf.gz 12:1000000-20000000 | ./vep --cache --vcf
```

Ensembl currently supports the two latest human assembly versions. We provide a cache using the latest software version (116) for both GRCh37 and GRCh38.

The [Ensembl VEP installer](#) will install and set up the correct cache and FASTA file for your assembly of interest. If using the --AUTO functionality to install without prompts, remember to add the assembly version required using e.g. "--ASSEMBLY GRCh37". It is also possible to have concurrent installations of caches from both assemblies; just use the [--assembly](#) to select the correct one when you run Ensembl VEP.

Once you have installed the relevant cache and FASTA file, you are then able to use Ensembl VEP as normal. If you are using GRCh37 and require database access in addition to the cache (for example, to look up variant identifiers using [--format id](#), see [cache limitations](#)), you will be warned you that you must change the database port in order to connect to the correct database:

```
ERROR: Cache assembly version (GRCh37) and database or selected assembly version (GRCh38) do not match
```

```
If using human GRCh37 add "--port 3337" to use the GRCh37 database, or --offline to avoid database connection entirely
```

If you have data you wish to map to a new assembly, you can use the Ensembl assembly converter tool - if you've downloaded Ensembl VEP, then you have it already! The tool is found in the `ensembl-tools/scripts/assembly_converter` folder. There is also an [online version of the tool](#) available. UCSC ([liftOver](#)) provides a tool for converting data between assemblies.

Summarising annotation

By default Ensembl VEP is configured to provide annotation on every genomic feature that each input variant overlaps. This means that if a variant overlaps a gene with multiple alternate splicing variants (transcripts), then a block of annotation for each of these transcripts is reported in the output. In the [default output format](#) each of these blocks is written on a single line of output; in [VCF output format](#) the blocks are separated by commas in the INFO field.

A number of options are provided to reduce the amount of output produced if this depth of annotation is not required.

Example

Input data (VCF - input.vcf)

```
##fileformat=VCFv4.2
#CHROM POS ID REF ALT
1 230710048 rs699 A G
1 230710514 var_2 A G,T
```

Example command and output (no "pick" option):

```
./vep --cache -i input.vcf -o output.txt

#Uploaded_variation Location Allele Gene Feature Feature_type Consequence cDNA_position
CDS_position Protein_position Amino_acids Codons Existing_variation Extra

Options

• --pick

This website requires cookies, and the limited processing of your personal data in order to function. By using the site you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

1. MANE Select transcript status

2. [MANE Plus Clinical transcript status](#)

3. canonical status of transcript

4. [APPRIS isoform annotation](#)

5. [transcript support level](#)

6. biotype of transcript ("protein_coding" preferred)

7. CCDS status of transcript

8. consequence rank according to [this table](#)

9. translated, transcript or feature length (longer preferred)

example command and output, with the "--pick" option.

```
./vep --cache -i input.vcf -o output.txt --pick

rs699    1:230710048    G        ENSG00000135744  ENST00000366667  Transcript

```

● --pick_allele

As above, but chooses one consequence block per variant allele. This can be useful for [VCF input files](#) with more than one ALT allele.

example of Ensembl VEP command and output, with the "--pick_allele" option.

```
./vep --cache -i input.vcf -o output.txt --pick_allele

rs699    1:230710048    G        ENSG00000135744  ENST00000366667  Transcript

```

● --flag_pick

Instead of choosing one block and removing the others, this option adds a flag "PICK=1" to picked annotation block, allowing you to easily filter on this later using the [filtering tool](#).

● --flag_pick_allele

As above, but flags one block per allele.

● --flag_pick_allele_gene

As above, but flags one block per allele and gene combination.

● --most_severe

This flag reports only the consequence type of the block with the highest rank, according to [this table](#).

example command and output, with the "--most_severe" option.

```
./vep --cache -i input.vcf -o output.txt --most_severe
```

```
rs699    1:230710048    - - - - missense_variant - - - - -
var_2    1:230710514    - - - - missense_variant - - - - -
```

● --summary

This flag reports only a comma-separated list of the consequence types predicted for this variant.

example command and output, with the "--summary" option.

```
./vep --cache -i input.vcf -o output.txt --summary
```

```
rs699    1:230710048    - - - - missense_variant,downstream_gene_variant -
- - - - -
var_2    1:230710514    - - - - missense_variant,synonymous_variant,downstream_gene_variant -
- - - - -
```

HGVS notations

Output

This website requires cookies, and the limited processing of your personal data in order to function. By using the site a
identifiers use [versioned](#) identifiers that guarantee the identifier refers always to the same sequence.
you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Genomic HGVS notations may be reported using `--hgvsg`. Note that the named reference for HGVSg notations will be the chromosome name from the input (as opposed to the officially recommended chromosome accession).

HGVS notations for insertions or deletions are by default reported in the most 3-prime representation in accordance with HGVS specifications. This may lead to discrepancies between the coordinates reported in the HGVS nomenclature and the coordinate columns reported by Ensembl VEP.

Reference sequence used as part of Ensembl VEP's HGVSg calculations is taken from a given FASTA file, rather than the variant reference. HGVSg is calculated using the given variant reference.

Input

Ensembl VEP supports using HGVS notations as input. This feature is currently under development and not all HGVS notation types are supported. Notations relative to genomic (g.) or coding (c.) sequences are fully supported; protein (p.) notations are supported in limited fashion due to the complexity involved in determining the multiple possible underlying genomic sequence changes that could produce a single protein change. A warning will be given if a particular notation cannot be parsed.

By default Ensembl VEP uses Ensembl transcripts as the reference for determining consequences, and hence also for HGVS notations. However, it is possible to parse HGVS notations that use RefSeq transcripts as the reference sequence by using the `--refseq` flag. Such notations must include the version number of the transcript e.g.

```
NM_080794.3:c.1001C>T
```

where ".3" denotes that this is version 3 of the transcript NM_080794. [See below](#) for more details on how Ensembl VEP can use RefSeq transcripts.

RefSeq transcripts

If you prefer to exclude predicted RefSeq transcripts (those with identifiers beginning with "XM_" or "XR_") use `--exclude_predicted`. We do not support predicted RefSeq transcripts for GRCh37

Identifiers and other data

The RefSeq cache lacks many classes of data present in the Ensembl transcript cache.

- Included in the RefSeq cache
 - Gene symbol
 - SIFT and PolyPhen-2 predictions
- **Not** included in the RefSeq cache
 - APPRIS annotation
 - TSL annotation
 - UniProt identifiers
 - CCDS identifiers
 - Protein domains
 - Gene-phenotype association data

Differences to the reference genome

RefSeq transcript sequences may differ from the genome sequence to which they are aligned. Ensembl's API (and hence Ensembl VEP) constructs transcript models using the genomic reference sequence. These differences are accounted for using [BAM-edited transcript models](#) in human cache files from release 90 onwards. Prior to release 90 and in non-human species differences between the RefSeq sequence and the genomic sequence are not accounted for, so some annotations produced on these transcripts may be inaccurate. Most differences occur in non-coding regions, typically in UTRs at either end of transcripts or in the addition of a poly-A tail, causing minimal impact on annotation.

For human Ensembl VEP cache files, each RefSeq transcript is annotated with the `REFSEQ_MATCH` flag indicating whether and how the RefSeq model differs from the underlying genome.

NCBI have released BAM files that contain alignments of RefSeq transcripts to the genome. From release 90 onwards, these alignments have been incorporated and used to correct the transcript models in the human RefSeq and merged cache files.

Ensembl VEP's cache building process uses the sequence and alignment in the BAM to correct the RefSeq model. If the corrected model does not match the original RefSeq sequence in the BAM, the corrected model is discarded. The success or failure of the BAM edit is recorded in the BAM_EDIT field of the Ensembl VEP output. Failed edits are extremely rare (< 0.01% of transcripts), but any annotations produced on transcripts with a failed edit status should be interpreted with extreme caution.

Using BAM-edited transcripts causes a change to how alleles are interpreted from input variants. Input variants are typically encoded in VCFs that are called using the reference genome. This means that the alternate (ALT) allele as given in the VCF may correspond to the reference allele as found in the corrected RefSeq transcript model. Ensembl VEP will account for this, using the corrected reference allele (by enabling `--use_transcript_ref`) when calculating consequences, and the GIVEN_REF and USED_REF fields in the output indicate any change made. If the reference allele derived from the transcript matches any given alternate (ALT) allele, then no consequence data will be produced for this allele as it will be considered non-variant. Note that this process may also clash with any interpretation from using `--check_ref`, so it is recommended to avoid using this flag.

To override the behaviour of `--use_transcript_ref` and force Ensembl VEP to use your input reference allele instead of the one derived from the transcript, you may use `--use_given_ref`.

You can also side-load BAM files at runtime to correct transcript models on-the-fly; this allows corrections to be applied for other species, where alignments are available, or when using RefSeq GFF files, rather than the cache.

```
./vep --cache --refseq -i variants.vcf --species mus_musculus --bam  
GCF_000001635.26_GRCm38.p6_knownrefseq_alns.bam
```

BAM files are available from NCBI:

- [Human GRCh38.p13](#)
- [Human GRCh37.p13](#)

Existing or colocated variants

Use the `--check_existing` flag to identify known variants colocated with input variant. The Ensembl VEP known variant cache is derived from Ensembl variation database and contains variants from dbSNP and [other sources](#).

By default a normalisation-based allele matching algorithm is used to identify known variants that match input variants. Since both input and known variants may have multiple alternate (ALT) or variant alleles, each pair of reference (REF) and ALT alleles are normalised and compared independently to arrive at potential matches. VCF permits multiple allele types to be encoded on the same line, while dbSNP assigns separate rsID identifiers to different allele types at the same locus. This means different alleles from the same input variant may be assigned different known variant identifiers.

```
#Uploaded_variation      Location      Allele Gene      Feature Feature_type      Consequence
cDNA_position    CDS_position    Protein_position      Amino_acids      Codons      Existing_variation
Extra
3_46358468_-/G    3:46358467-46358468      G      ENSG00000121807  ENST00000292301 Transcript
frameshift_variant,splice_region_variant      1425-1426      940-941 314      S/RX      agc/aGgc
-
IMPACT=HIGH;STRAND=1
...
```

However, with `--shift_3prime` switched on, Ensembl VEP will right align all insertions and deletions within repeated regions, shifting the inserted G two positions to the right before consequence calculation, providing the `splice_donor_variant` consequence instead.

```
./vep --cache -id '3 46358467 . A AG' --shift_3prime 1
```

```
#Uploaded_variation      Location      Allele Gene      Feature Feature_type      Consequence
cDNA_position    CDS_position    Protein_position      Amino_acids      Codons      Existing_variation
Extra
3_46358468_-/G    3:46358467-46358468      G      ENSG00000121807  ENST00000292301 Transcript
splice_donor_variant      -      -      -      -      -      IMPACT=HIGH;STRAND=1
...
```

Using `--shift_genomic` will also update the location field. However, `--shift_genomic` will also shift intergenic variants, which can lead to a reduction in performance.

```
./vep --cache -id '3 46358467 . A AG' --shift_genomic 1
```

```
#Uploaded_variation      Location      Allele Gene      Feature Feature_type      Consequence

splice_donor_variant      -      -      -      -      -      IMPACT=HIGH;STRAND=1
...
```

When shifting, insertions or deletions of length 2 or more can lead to alterations in the reported alternate allele. For example, an insertion of GAC that can be shifted 2 bases in the 3' direction will alter the alternate allele to CGA.

```
./vep --cache -id '3 46358464 . A AGAC' --shift_3prime 1
```

```

For any questions not covered here, please send an email to the Ensembl [developer's mailing list](#) (public) or contact the [Ensembl Helpdesk](#) (private). Also you can report issues through our (public) Github repositories. For general Ensembl VEP issues you should use [ensembl-vep](#) repository and for specific plugins you should use [VEP_plugins](#) repository.

General questions

Q: Why has my insertion/deletion variant encoded in VCF disappeared from the output?

Ensembl treats unbalanced variants differently to VCF - your variant hasn't disappeared, it may have just changed slightly! You can solve this by giving your variants a unique identifier in the third column of the VCF file. See [here](#) for a full discussion.

Q: Why don't I see any co-located variants when using species X?

Not all species have variants and not all species that do are in the Ensembl variation resource - see [this document](#) for details. The [custom](#) option can be used in the commandline interface to include more variant sets

Q: Why do I see multiple known variants mapped to my input variant?

Ensembl VEP compares your input to known variants from the Ensembl variation database. In some cases one input variant can match multiple known variants:

- Germline variants from dbSNP and somatic mutations from COSMIC may be found at the same locus
- Some sources, e.g. HGMD, do not provide public access to allele-specific data, so an HGMD variant with unknown alleles may colocate with one from dbSNP with known alleles
- Multiple alternate alleles from your input may match different variants as they are described in dbSNP

See [here](#) for a full discussion.

Q: Ensembl VEP is not assigning a frequency to my input variant - why?

Ensembl VEP's cache contains frequency data only for specific studies. See [here](#) for a full discussion. The [custom](#) option can be used in the commandline interface to include more frequency sets

Q: Why do I see so many lines of output for each variant in my input?

While it would be convenient to have a simple, one word answer to the question "What is the consequence of this variant?", in reality biology is not this simple! Many genes have more than one transcript, so Ensembl VEP provides a prediction for each transcript that a variant overlaps. Ensembl VEP has options to help select results according to your requirements; the [--canonical](#) and [--mane](#) options indicate which transcripts are canonical and belong to the human MANE set respectively, while [--pick](#), [--per_gene](#), [--summary](#) and [--most_severe](#) allow you to give a more summary level assessment per variant.

Furthermore, several "compound" consequences are also possible - if, for example, a variant falls in the final few bases of an exon, it may be considered to affect a splicing site, in addition to possibly affecting the coding sequence.

Q: How do I reduce Ensembl VEP's memory requirement?

There are a number of ways to do this-

1. Ensure your input file is sorted by location. This can greatly reduce memory requirements and runtime
2. Consider reducing the buffer size. This reduces the number of variants annotated together in a batch and can be modified in both command line and web interfaces. Reducing buffer size may increase run time.
3. Ensure you are only using the options you need, rather than [--everything](#). Some data-rich options, such as regulatory annotation have an impact on memory use

Q: How to cite Ensembl you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Ensembl VEP web interface questions

Q: How do I access the web version of the Ensembl Variant Effect Predictor?

You can find the Ensembl VEP web tool on the [Tools](#) page.

Q: Why is the output I get for my input file different when I use the Ensembl VEP web and command line interfaces?

Ensure that you are passing equivalent arguments to the command line tool that you are using in the web interface. If you are sure this is still a problem, please report it on the [ensembl-dev](#) mailing list.

Q: Is there a tutorial for the web tool?

Yes, see our latest tutorial [Annotating and prioritizing genomic variants using the Ensembl Variant Effect Predictor — A tutorial](#) for more information on using the Ensembl VEP web interface.

Ensembl VEP command line tool questions

Q: How can I make Ensembl VEP run faster?

There are a number of factors that influence how fast Ensembl VEP runs. Have a look at our [handy guide](#) for tips on improving runtime.

Q: Why am I not seeing the same variant from my input in the output?

Since the Ensembl 110 release, Ensembl VEP by default will minimise the input allele for display in the output. To see the exact allele representation you provided, use the `--uploaded_allele` option.

Q: Why do I see "N" as the reference allele in my HGVS strings?

Q: Why do I get errors related with Sequence.pm?

```
substr outside of string at /nfs/users/nfs_w/wm2/Perl/ensembl-variation/modules/Bio/Ensembl/Variation/Utils/Sequence.pm line 511.  
Use of uninitialized value $ref_allele in string eq at /nfs/users/nfs_w/wm2/Perl/ensembl-variation/modules/Bio/Ensembl/Variation/Utils/Sequence.pm line 514.  
Use of uninitialized value in concatenation (.) or string at /nfs/users/nfs_w/wm2/Perl/ensembl-variation/modules/Bio/Ensembl/Variation/Utils/Sequence.pm line 643.
```

Both of these error types are usually seen when using a [FASTA file](#) for retrieving sequence. There are a couple of steps you can take to try to remedy them:

1. The index alongside the FASTA can become corrupted. Delete [fastafilename].index and re-run Ensembl VEP to regenerate it. By default this file is located in your \$HOME/.vep/[species]/[version]_[assembly] directory.
2. The FASTA file itself may have been corrupted during download; delete the fasta file and the index and re-download (you can use the [Ensembl VEP installer](#) to do this).
3. Older versions of BioPerl (1.2.3 in particular is known to have this) cannot properly index large FASTA files. Make sure you are using a later (>=1.6) version of BioPerl. The [Ensembl VEP installer](#) installs 1.6.924 for you.

If you still see problems after taking these steps, or if you were not using a FASTA file in the first place, please [contact us](#).

Q: Why are chromosomes not found in annotation sources or synonyms?

WARNING: Chromosome 21 not found in annotation sources or synonyms on line 160.
This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

This can occur if the chromosome names differ between your input variant and any annotation source that you are using (cache, database, GFF/GTF file, FASTA file, custom annotation file). To circumvent this you may provide a [synonyms file](#). A synonym file is included in Ensembl VEP's cache files, so if you have one of these for your species you can use it as follows:

```
./vep -i input.vcf -cache -synonyms ~/.vep/homo_sapiens/116_GRCh38/chr_synonyms.txt
```

The file consists of lines containing pairs of tab-separated synonyms. Order is not important as synonyms can be used in both "directions".

Q: Why do I get feature_type warnings from my GFF/GTF file?

```
WARNING: Ignoring 'five_prime_utr' feature_type from Homo_sapiens.GRCh38.111.gtf.gz GFF/GTF file.  
This feature_type is not supported in Ensembl VEP.
```

This can occur if you are using GFF/GTF file and the file contains a type that is not supported by Ensembl VEP. Those lines are simply ignored. However, in cases where the transcript model is incomplete the full model may be ignored.

Please try to use supported feature types as mentioned [here](#)

Q: Can I get gnomAD exomes and genomes frequencies in Ensembl VEP?

Yes, see [this guide](#).

Q: Why do I have issues connecting to Ensembl databases?

```
Could not connect to database homo_sapiens_core_63_37 as user anonymous using  
[DBI:mysql:database=homo_sapiens_core_63_37;host=ensembl.db.ensembl.org;port=5306] as a locator:  
Unknown MySQL server host 'ensembl.db.ensembl.org' (2) at  
$HOME/src/ensembl/modules/Bio/EnsEMBL/DBSQL/DBConnection.pm line 290.
```

```
----- EXCEPTION -----  
MSG: Could not connect to database homo_sapiens_core_63_37 as user anonymous using  
[DBI:mysql:database=homo_sapiens_core_63_37;host=ensembl.db.ensembl.org;port=5306] as a locator:  
Unknown MySQL server host 'ensembl.db.ensembl.org' (2)
```

If you select the database option rather than using a cache Ensembl VEP will try to connect to the public MySQL server at [ensembl.db.ensembl.org](#). Occasionally the server may break connection with your process, which causes this error. This can happen when the server is busy, or due to various network issues. Consider using the [caching system](#). Using a cache and fasta file is the most efficient way to run Ensembl VEP

Q: Can I use Ensembl VEP on Windows?

Yes - see the [documentation](#) for a few different ways to get the Ensembl VEP running on Windows.

Q: Can I use Ensembl VEP with species and assemblies which are not available in Ensembl?

Yes - you can run Ensembl VEP on any species you have data for by providing a custom gene annotation in [GFF/GTF](#) and genome sequence in [FASTA](#) file, like so:

```
./vep -i input.vcf --gff data.gff.gz --fasta genome.fa.gz
```

Q: Can I use Ensembl VEP with T2T-CHM13 and other human assemblies?

Yes - you can run Ensembl VEP using [Human Pangenome Reference Consortium \(HPRC\)](#) data by following the instructions [here](#). This website requires cookies, and the limited processing of your personal data in order to function. By using the site

you are agreeing to this as outlined in our [Privacy Policy](#) and [Terms of Use](#)

Q: Can I download all of the SIFT and/or PolyPhen predictions?

The Ensembl Variation database and the human Ensembl VEP cache file contain precalculated SIFT and PolyPhen-2 predictions for every possible amino acid change in every translated protein product in Ensembl. Since these data are huge, we store them in a [compressed format](#).

There are different approaches to download SIFT/PolyPhen-2 data:

- Using the [PolyPhen SIFT plugin](#):
 - For any species with predictions in our Ensembl databases, the plugin is able to download the predictions data into a local SQLite database for offline use. PolyPhen predictions are only available for human data.
 - We also provide a downloadable SQLite database containing PolyPhen/SIFT predictions based on [Human Pangenome Reference Consortium \(HPRC\)](#) and GRCh38 assemblies. For more information, refer to [Missense deleteriousness predictions](#) in HPRC assemblies.
- Using our **Perl API**:
 - Fetch a [ProteinFunctionPredictionMatrix](#) for your protein of interest and then call its [get_prediction\(\)](#) method to get the score for a particular position and amino acid, looping over all possible amino acids for your position.
 - You would need to work out which peptide position your codon maps to, but there are methods in the [TranscriptVariation](#) class that should help you (probably [translation_start\(\)](#) and [translation_end\(\)](#)).
